

Designing for the future against crime and terrorism

**DESIGN
AGAINST
CRIME**

Paul Ekblom

Design Against Crime Research Centre

Central Saint Martins College of Arts & Design

University of the Arts London

Every design is a bet on the future

- Can product be made?
- Will it work?
- Will it last or fall to bits?
- Will it sell at a profit – what's the competition?
- Will people use it as intended?
- *Will it be involved in crime?*

What is Design Against Crime?

DAC uses the tools, processes & products of design to work in partnership with agencies, companies, individuals and communities to

- prevent all kinds of **crime** – including antisocial behaviour, drug abuse/ dealing and terrorism
- promote quality of life & sustainable living through enhanced **community safety**

through designs that are 'fit for purpose' and contextually appropriate in all other respects

...and DAC can be quirky too

Scope of Design Against Crime

- Secure products
- Security products
- Security components
- Security features/ furniture
- Secure systems
- Secure information
- Security communication/ art
- Secure clothing
- Secure places/ environments
- Secure communities

Design is about *processes*, not just products!

Inherently secure product ... then

...and now - Vexed Generation/ Puma

Hard or soft target?

Evolution of a secure product – Preventing the clipping of coins

Hammered

Milled

Security product – Clothes tagging device

Security Product/ Security Communication

Danger!

Security component – Brand Protection

Security Features/ Furniture/ Accessories

Security System – Chips Protect High-Value Alpacas

Security Communication

Common Perpetrator Techniques

Up and Over (Lifting): Thieves remove the top of the post (possibly a sign), and lift the bicycle off. They often replace the top afterwards.

TIP - Always lock frame and both wheels to a cycle stand

Mind the Gap (Leverage): Thieves use the gap between the bike and the stand left by a loosely fitted lock to insert tools such as jacks, croppers or jemmies or may twist the bike against the lock to break it free.

Breaking the chain (Impact): Thieves take advantage when the chains or locks are in contact with the ground and use a hammer and cold chisel to split them. Cheaper D-locks are vulnerable to a direct strike against the protruding end.

TIP - Don't ride with valuables in open baskets or panniers

Parking Error (Unbolting): Only one lock has been used, and thieves steal the rest of the bike. Any easily removable part of the bike is vulnerable, unless locked up or removed by the owner.

TIP - you cannot use a cycle stand, please respect others' property when parking

Security Communication/Art

Security Clothing – Wearable Solutions

Secure Place: Maiden Castle

Secure Communities

Designing for social cohesion & conflict reduction

Hi-tech solution

Lo-tech solution

Note that here, security derives from combined features of product and place

Does DAC work?

- Car theft
- Mobile phone cloning
- Underground ticket machine slugs
- Secured By Design/CPTED
- But more hard evidence needed

The challenge of DAC

The challenge of DAC: Troublesome Tradeoffs

Can we design secure products *without* jeopardising their main purpose and *without* their being

- Inconvenient?
- User-unfriendly?
- Ugly? Effective but hideous & clunky engineering solutions
- A threat to privacy?
- Environmentally unfriendly?
- Unsafe?
- Too expensive?

Yes! Tradeoffs can be resolved...

- **Where Design Expertise is fully engaged, early in the Design Process**
- **And all these considerations are incorporated in the Requirements Capture with sufficient priority**

Secure products need not be ugly

Anti-Terrorism need not be frightening

DAC doesn't have to be expensive

Subtle and dynamic – the ultimate tradeoff?

The challenge of DAC – **Caught unaware – failure to anticipate**

- Product designed naïve to crime
- Crime harvest
- Retrofit solutions
 - Constrained
 - Rushed
 - Legacy of crime and/or inconvenience

What made Queen Victoria go red?

The challenge of DAC – Offenders fight back

- Tactical countermoves
 - in situ
 - return better tooled
- Counter-exploitation
- Strategic counter-design
- Reverse engineering

Open to release

Close handles to pull out dents

Repair car dents quickly and easily!

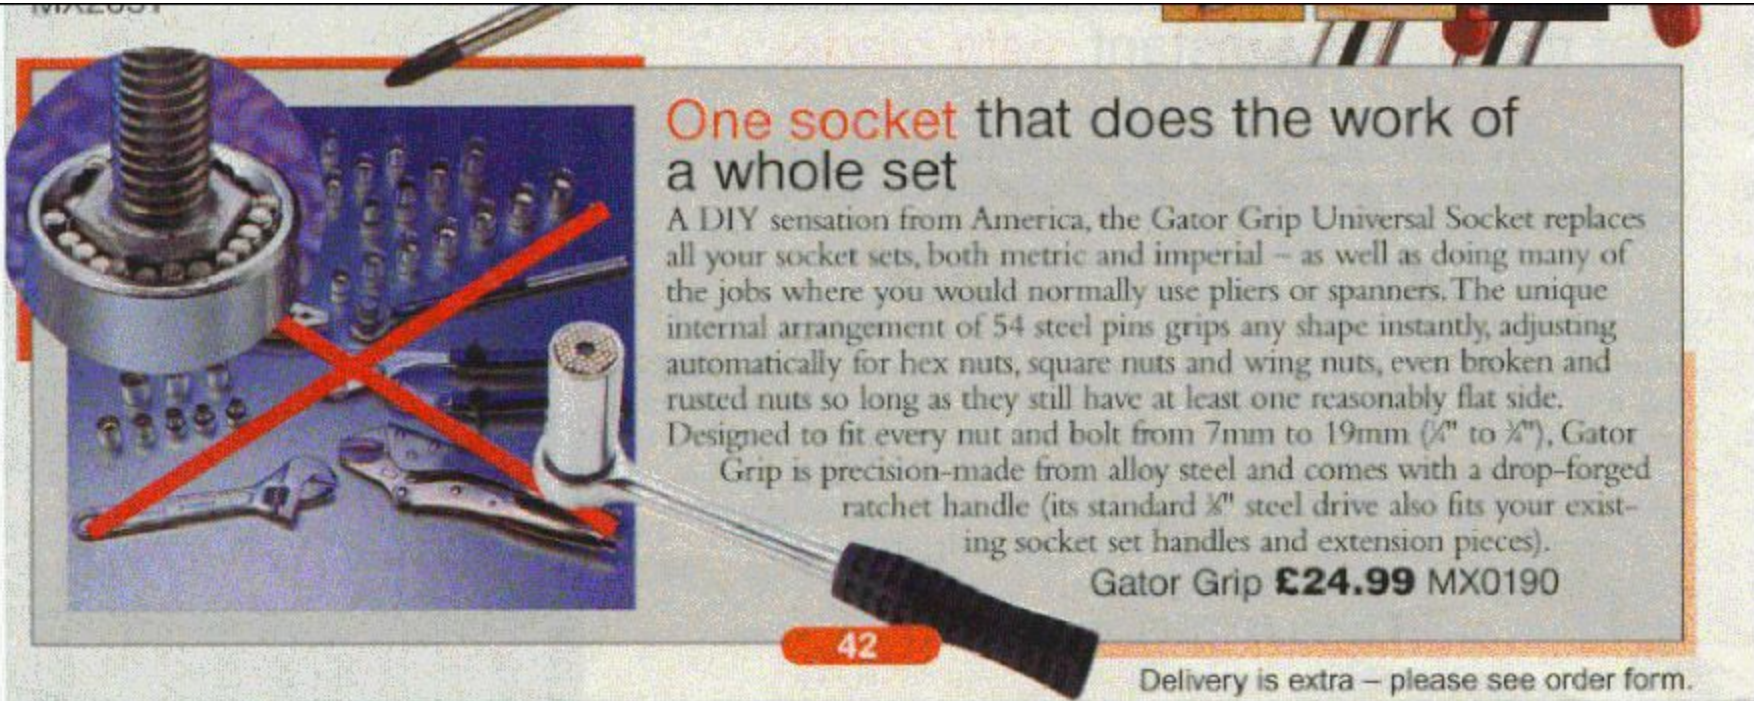

For minor dents on your bodywork the Dent Puller is the answer with vastly improved suction compared to others on the market. Simply place the cup over the dent, click the handles shut for automatic suction and gently pull out the dent. Open the handles to release the vacuum and remove without damaging the paintwork. No need to pay expensive panel beaters' bills! Can also be used to carry safely sheets of glass, metal, mirrors, etc.

Car Dent Puller Deluxe **£12.99** MX0220

The challenge of DAC – Obsolescence

- Adaptive offenders' countermoves
- Changing social conditions
- New tools/ skills for crime

One socket that does the work of a whole set

A DIY sensation from America, the Gator Grip Universal Socket replaces all your socket sets, both metric and imperial – as well as doing many of the jobs where you would normally use pliers or spanners. The unique internal arrangement of 54 steel pins grips any shape instantly, adjusting automatically for hex nuts, square nuts and wing nuts, even broken and rusted nuts so long as they still have at least one reasonably flat side. Designed to fit every nut and bolt from 7mm to 19mm ($\frac{1}{4}$ " to $\frac{3}{4}$ "), Gator Grip is precision-made from alloy steel and comes with a drop-forged ratchet handle (its standard $\frac{1}{2}$ " steel drive also fits your existing socket set handles and extension pieces).

Gator Grip £24.99 MX0190

42

Delivery is extra – please see order form.

Beware cookbook copying – Importance of context for replication

ELECTRONICALLY SECURED CYCLE PARKING

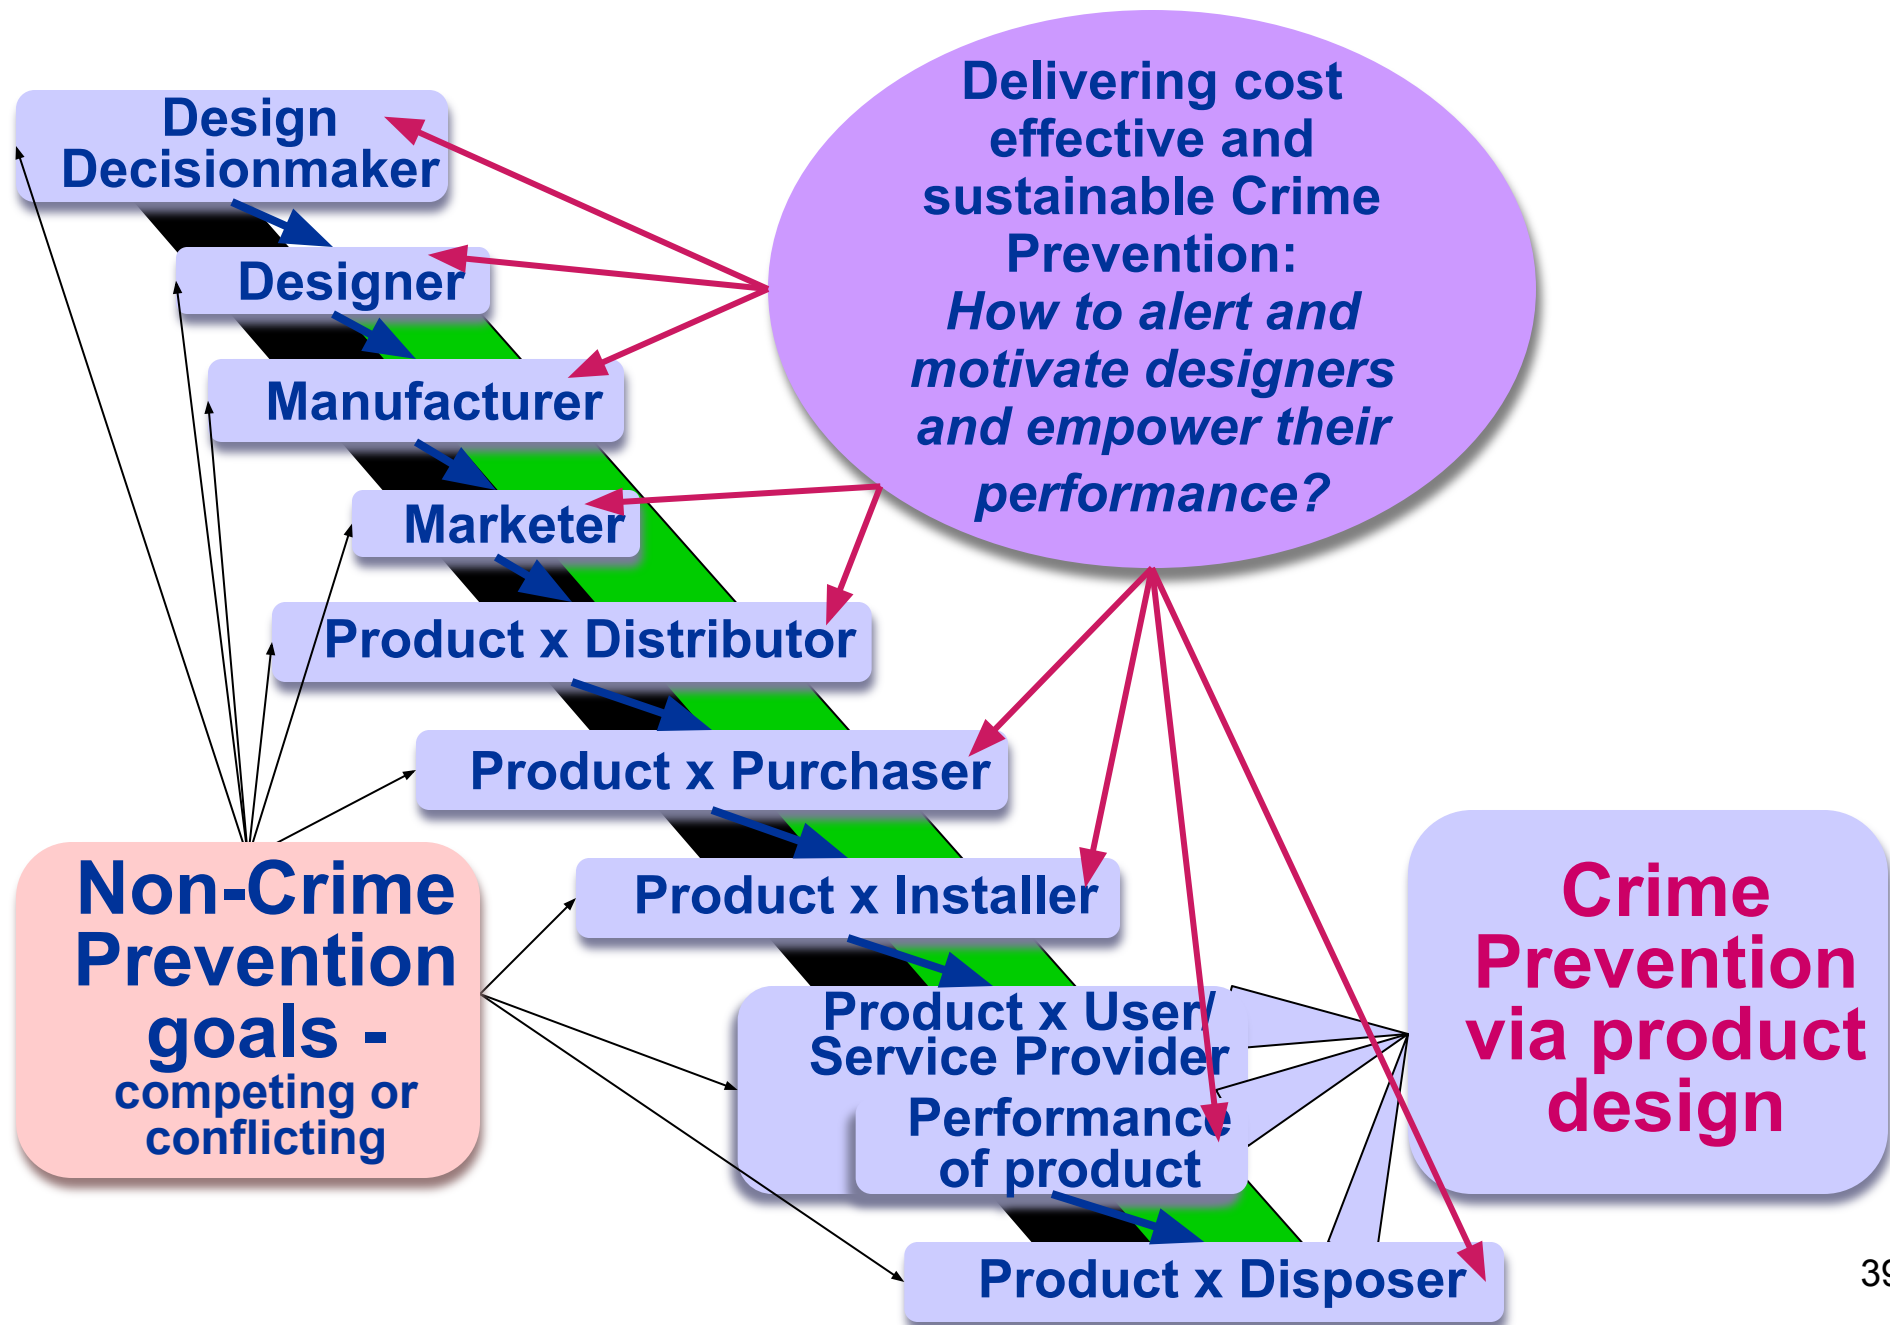

GHENT, BELGIUM

WALTHAMSTOW CENTRAL STATION, LONDON

That bet on the future...Reducing Crime by Design - a Succession of Performances

Meeting the challenge

- We have to innovate faster than offenders whilst adapting to context of users and crimes
- This needs
 - Motivation
 - Capacity development
 - Collaboration between Preventers and Designers

Design – product or process?

- Is design what we make, how we make it, or both?

Implementing DAC through process:

Getting designers to

Think Thief

...and

crime preventers to

Draw on Design

Helping designers think thief – Developing & building capacity for DAC

- Mindset
- Clear definitions – tools for thought
- Knowledge for interventions
- Knowledge management – capturing & replicating good practice and supporting innovation without stifling creativity
- Anticipation

**A receptacle
for grime?**

**Wrong
mindset
for design:
failure to
think thief**

**Or a tool
for crime?**

Giving designers knowledge from crime prevention – Maps and frameworks

- Importance of *Rationale* for design –

Problem, consequences and context

- Causes

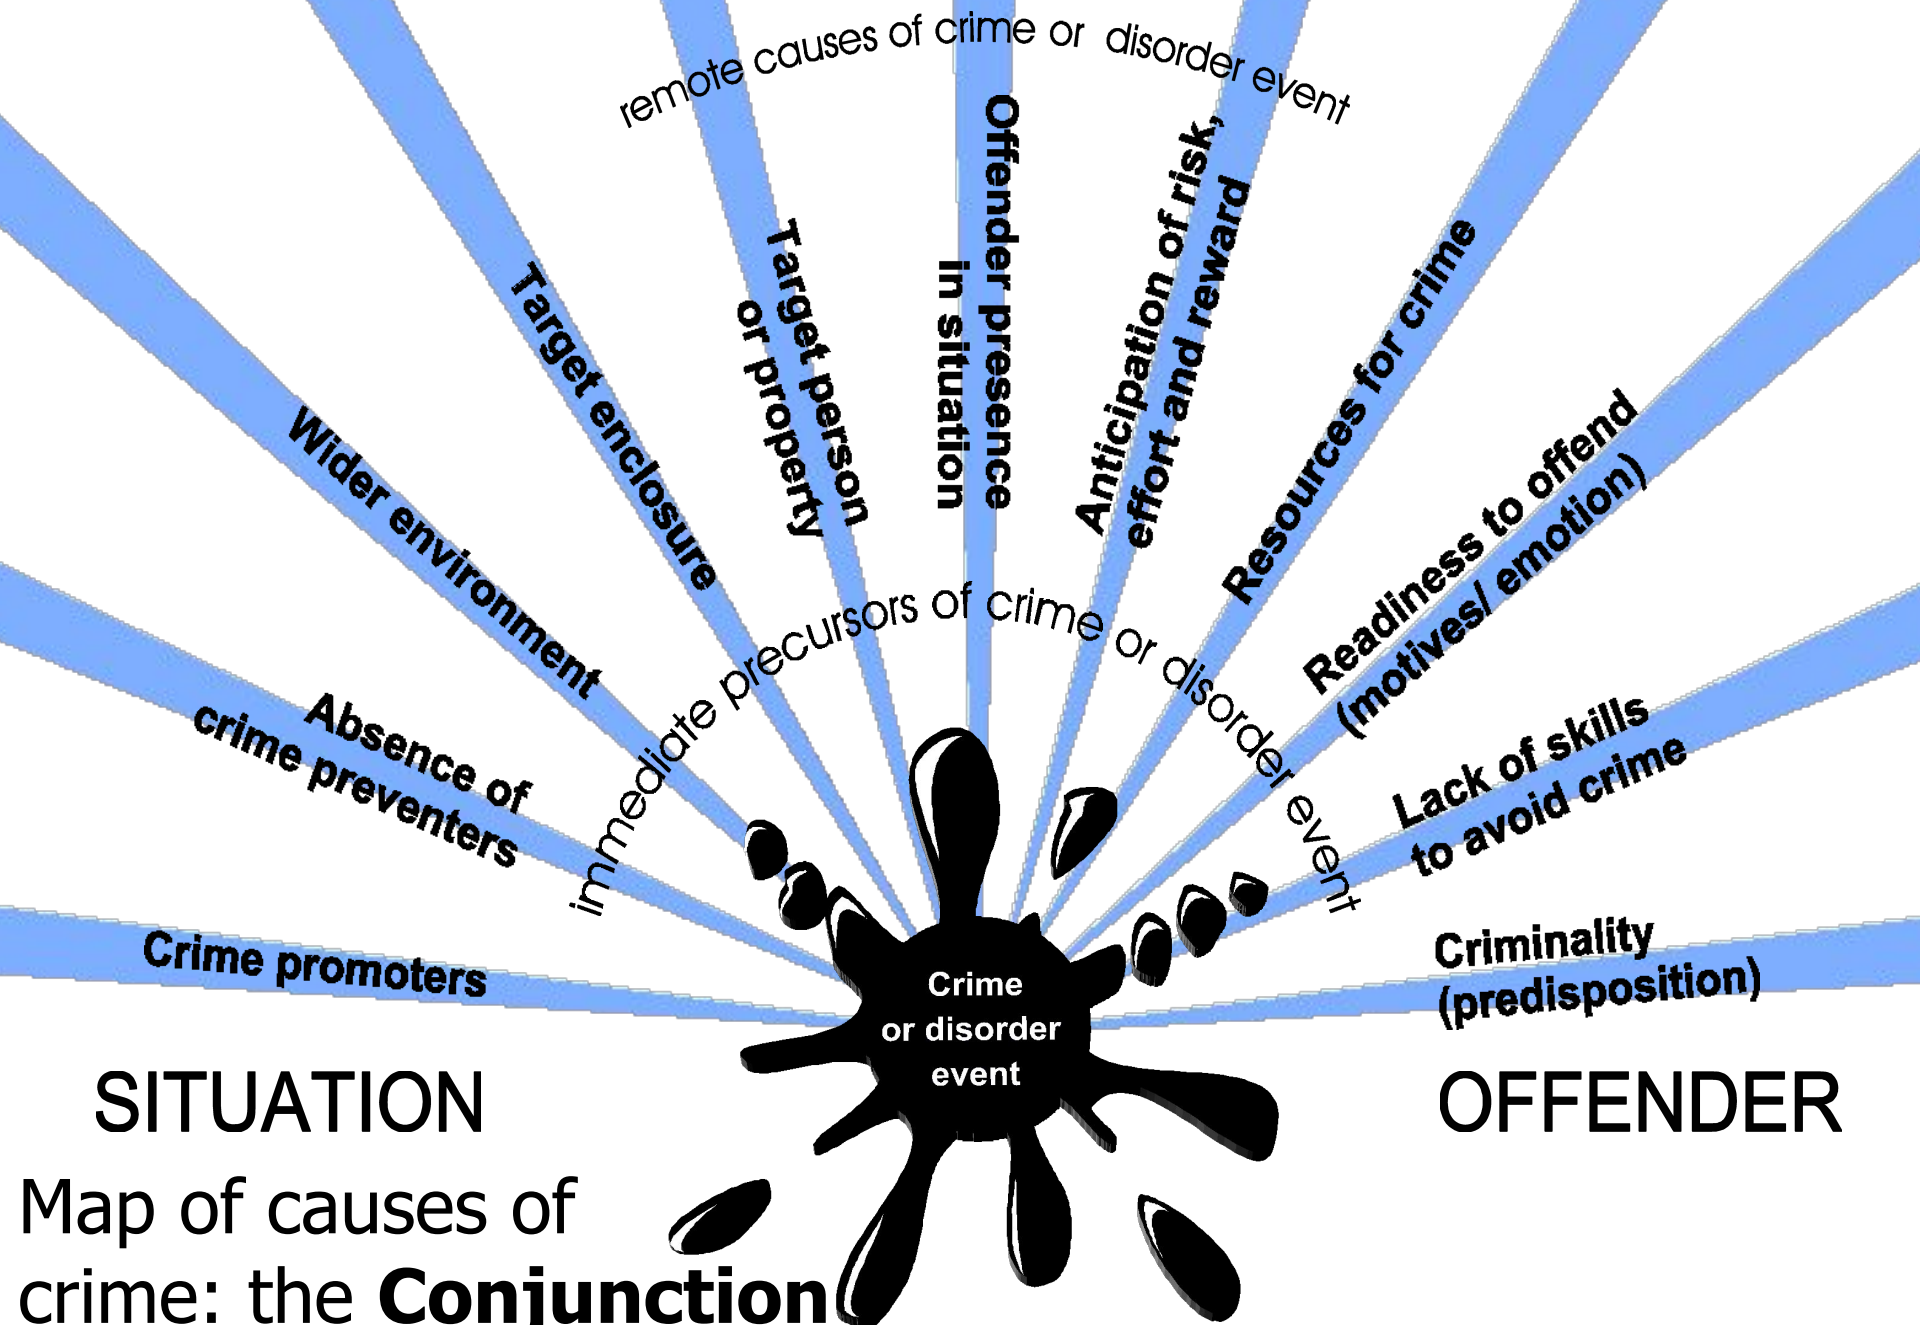

- Intervention principles

- Intervention practice

Can use Crime Triangle, or RAT

But I prefer...

remote causes of crime or disorder event

Target person
or property

Target enclosure

Wider environment

Absence of
crime preventers

Crime promoters

Offender presence
in situation

Anticipation of risk,
effort and reward

Resources for crime

Readiness to offend
(motives/emotion)

Lack of skills
to avoid crime

Criminality
(predisposition)

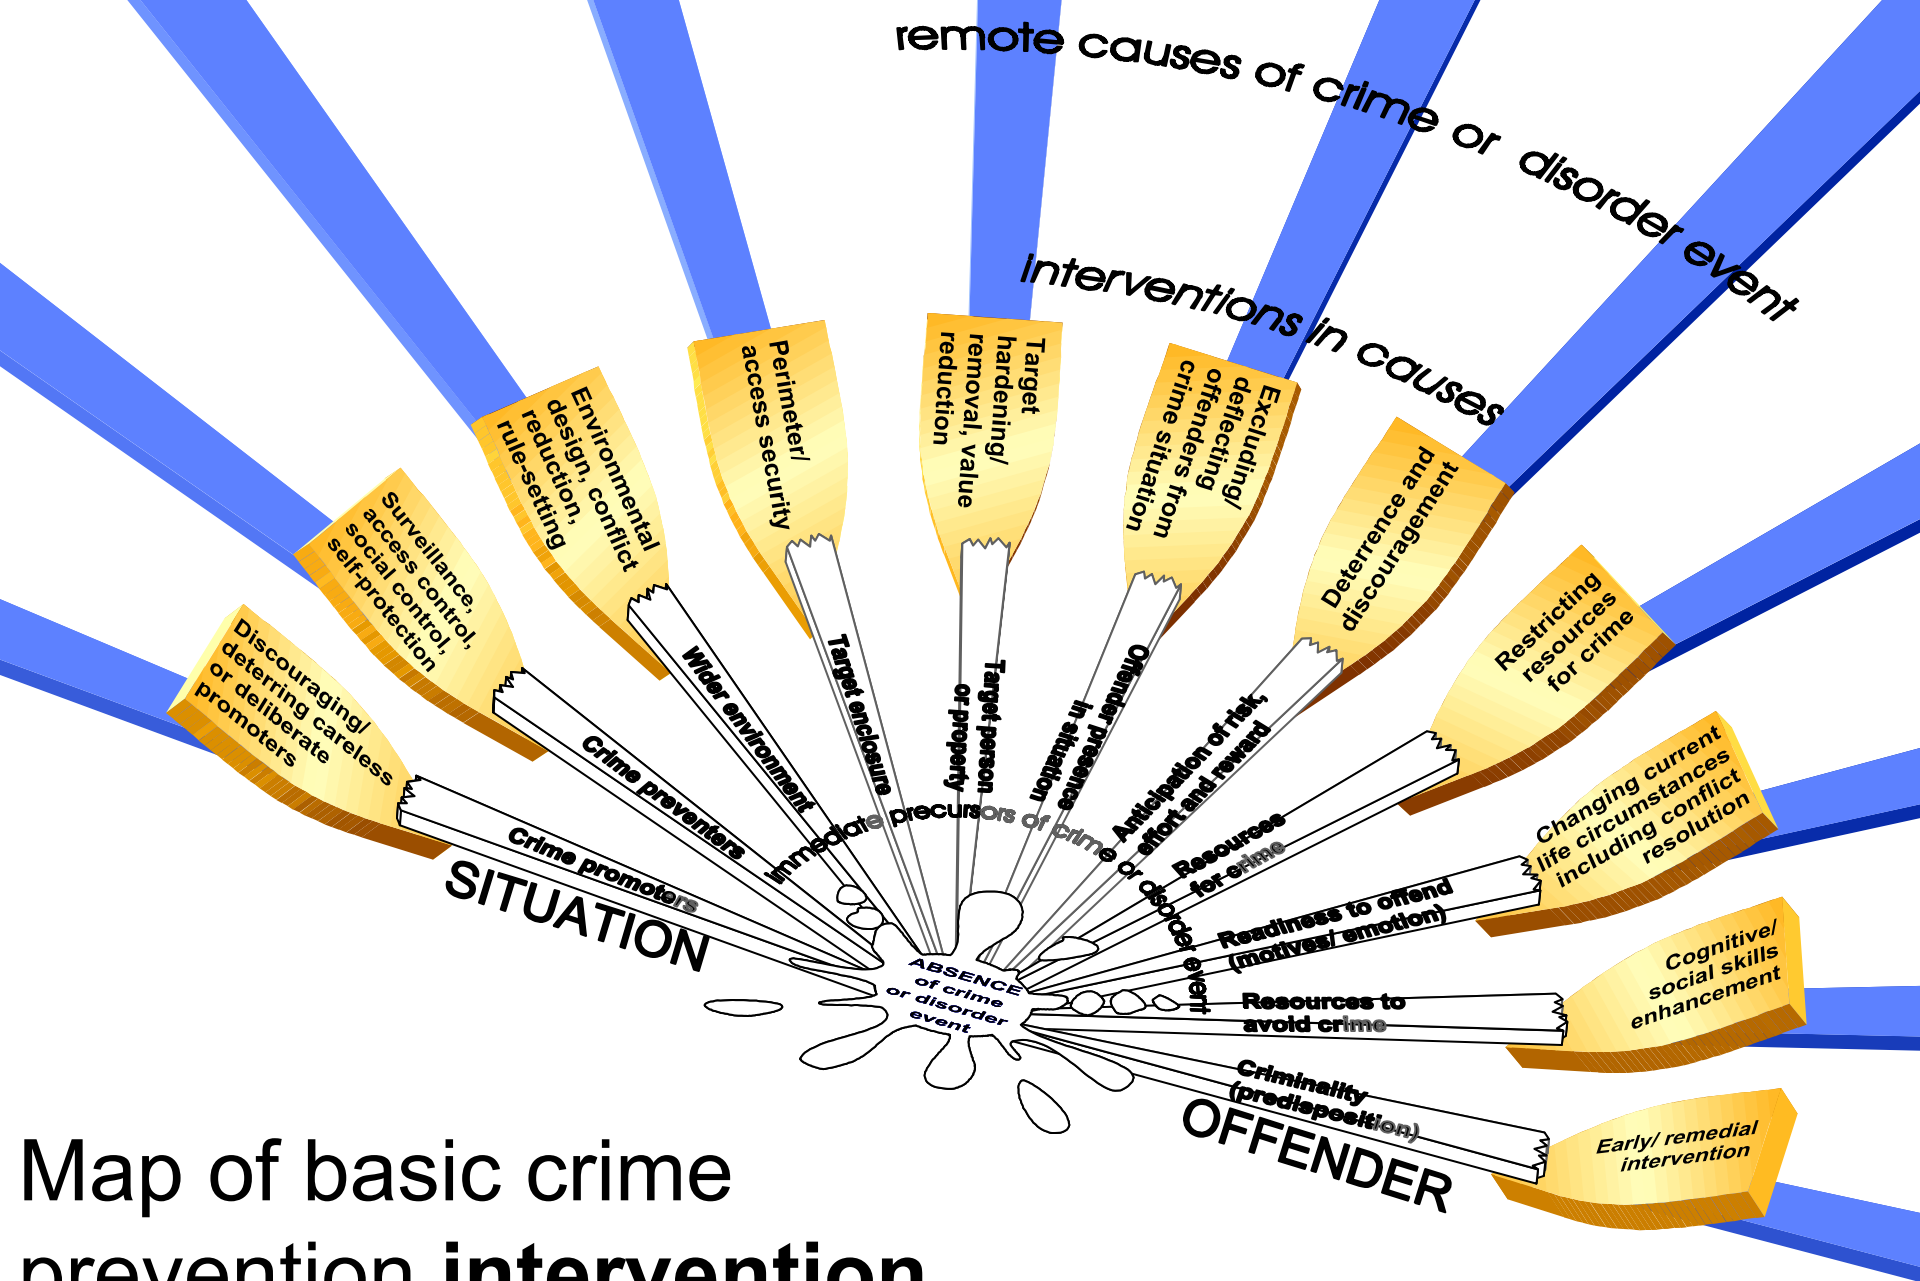

immediate precursors of crime or disorder event

Crime
or disorder
event

SITUATION

OFFENDER

Map of causes of
crime: the **Conjunction
of Criminal Opportunity**

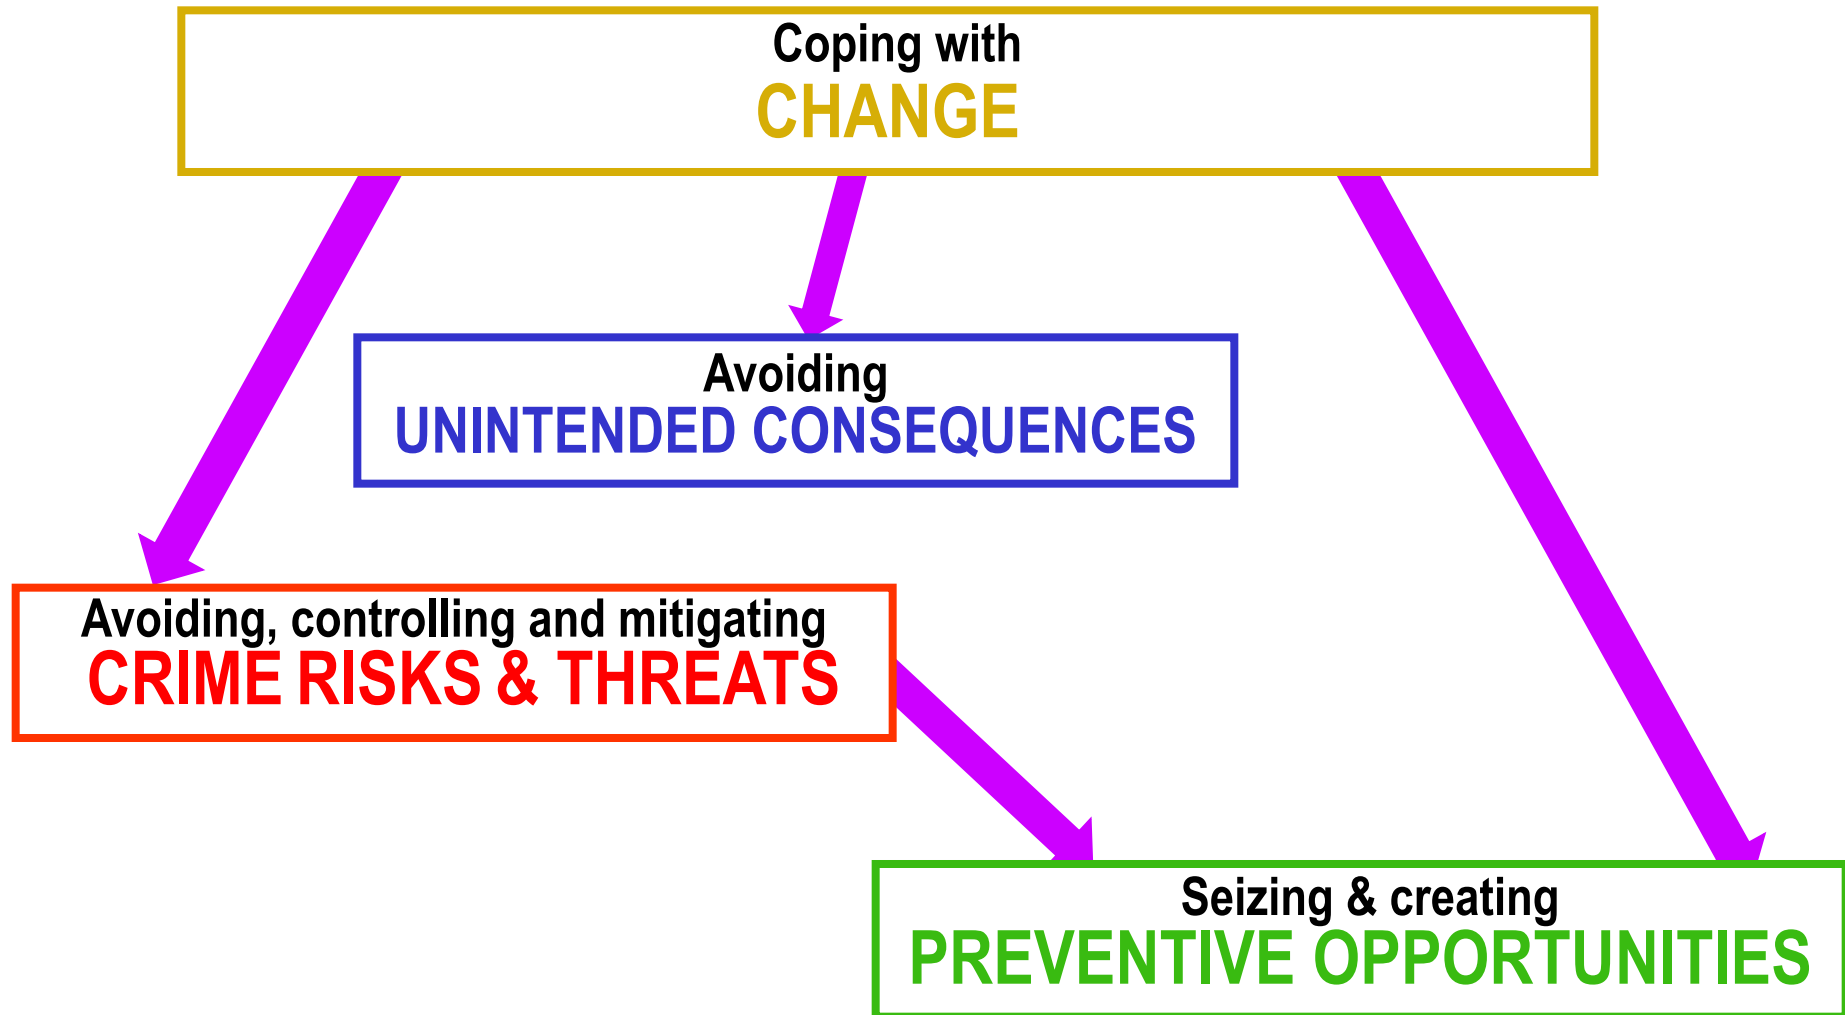

Map of basic crime prevention **intervention principles**

**But... designers must be both
disciplined and creative**

Anticipation in Crime Prevention

The **Anticipation** dimension

- **Crime Risk Assessment** – specific **incoming** threats from elsewhere affecting one's own activity
- **Crime Impact Assessment** – specific **exported** threats from one's own activity
- **Horizon Scanning**
 - All-encompassing approach over a range of timescales eg 5-50yrs
 - needs wider knowledge of **trends** and forecasting of **events** over 'PESTLES' dimensions (political, economic, social, technological, legal, environmental, scientific) and their interactions
 - Makes plausible forecasts backed by **evidence, theory and logic** – inexact but not wild guesses or fringe ideas
 - Helps manage a **range** of risks and opportunities – 'futures thinking', not 'predicting a specific future' – policy and practice designed to be **robust across this range**

Crime and design - futures

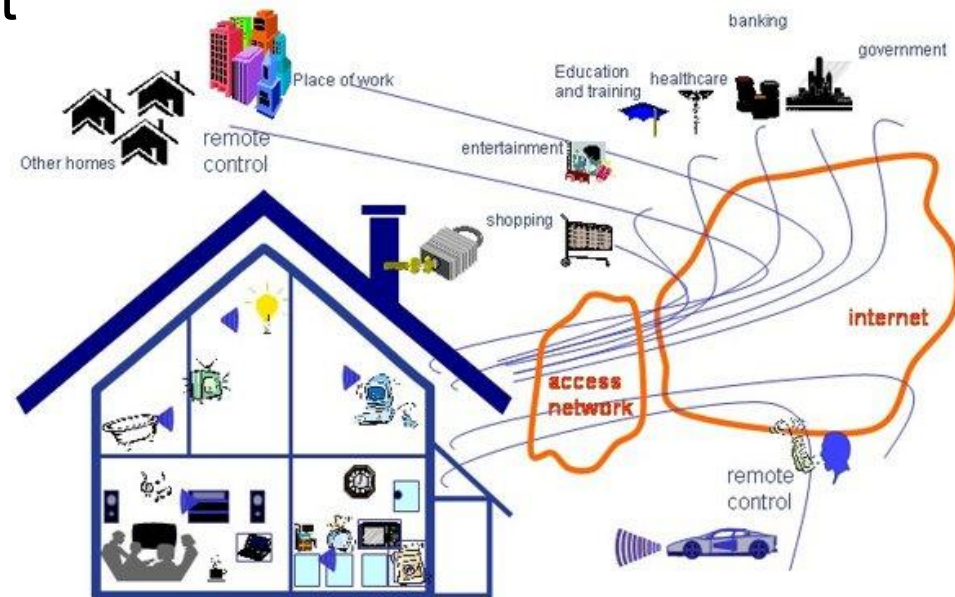

- Changing crime – new tools, new targets
- Changing priorities
 - Sustainability
 - Low energy
 - Resilience to climate shift, terrorism
 - Privacy/freedom v security

Crime and design - futures

Changing context on all scales – crime threats and CP opportunities

- New land uses
- Blur between products, places, systems
- Intelligent homes/products linked to internet
- Automobiles v public transport
- Cameraphones – changing nature of ‘eyes on street’
- Intelligent CCTV, multimodal alarm systems
- New materials – sensitive, resilient, anti-graffiti?

How to Anticipate – Building on knowledge of correlations & causes

- Empirical approaches
 - Projection of linear trends
 - Statistical modelling of cycles etc
 - eg time series techniques
 - Risk and protective factors - CRAVED
 - But - **nonlinearities**
- Theory and logic
 - In each case we can use CCO (as an integrated map of theories) to systematically ask **‘Will the forecast changes affect *this* cause of crime, beneficially or harmfully? The potency and implementability of *this* preventive intervention?’** Can home in further by additionally using **types** of crime threat or of crime problem
 - Major issue with all theory is that many causes **interact** – CP theory has limited knowledge of such interactions
- Simulation – software agent-based modeling – may be able to explore emergent processes from these interactions

Misdeeds & Security Framework – for anticipating types of crime threat & crime prevention opportunity from scientific & technological innovations

Misdeeds (Ms)	Security (Ss)	
Misappropriated - stolen	Secured against theft	
Mistreated – damaged	Safeguarded against damage	
Misused – tool/weapon for crime	Shielded against misuse	Supporting justice/ crime reduction/ community safety
Mishandled – fraud, counterfeit	Scam-proofed	
Misbehaved with – disorder/ASB	‘Sivilised’	
Mistaken – false alarm	Slip-proofed	
Mistrusted/ Misunderstood	‘Sertain’ to report/ understand	
Misaligned – adverse side effects	Straightening adverse side-effects	

Developing fundamental capacity – Theory into practice – from risk analysis to design guidance

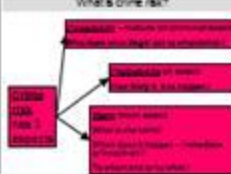

What Theory Knows Is...

Using theory to analyse crime risks and generate design guidance for secure bike parking

Paul Exblom

What's crime risk?

Design Against Crime seeks to

- Reduce the **probability** of criminal events
- Reduce the **probability** of criminal events
- Reduce the **probability** of criminal events

How can DAC be helped to do this?

Sources of guidance for designers

- Prior practical experience
- Research and evaluation
- Theory
- With bike parking

Two-pronged attack

The approach via theory

- Theory doesn't come out of blue
- Theory can be used here: in research and experience, compressed, refined and tested, and described in a rigorous and systematic way
- Theory needs to cause & effect
- Key concepts are
- Structure
- How an individual or the system
- How the system is used
- Context
- How the system is used to help the user

In practice, this means...

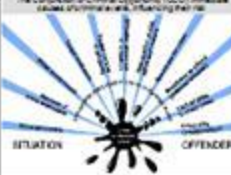

Which theory?

Conjunction of Criminal Opportunity

- Supports risk analysis by
- Supports design responses by

The Conjunction of Criminal Opportunity (CCO) model

Identifying Possibility using CCO theory

CCO also describes immediate context of criminal events

The designed product itself suffers crime risk in two ways

So the whole CCO exercise covers

As object (with protection)

In function (enriching other things)

When does a context become a design?

- In the case of the bike stand as object in function, the environment is simply part of the natural context within which the designs operate
- With the complete bike parking facility, environment and/or enclosure are designed with security and other functions in mind

Which specific crime risks do these objects or systems face?

CCO is very generalised – to identify risks we need to look at different crime types

- But there are hundreds of crime categories of crime – how to tame the variety?
- Misdeeds & Security Theory
- This takes the generalised CCO and focuses them on specific links of crime risk and preventive intervention

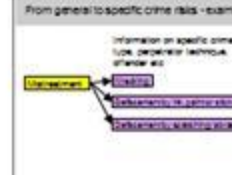

Misdeeds & Security – Types of criminal behaviour

Identifying Possibility using CCO and Misdeeds & Security framework together

From general to specific crime risks – example

Crime risks to designed object – Furniture – bike stand

Crime risks to designed object – Furniture – bike stand

Crime risks to designed object – Furniture – bike stand

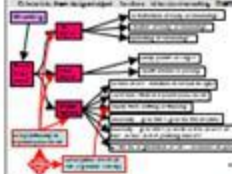

Design guidance – stand as object (1)

www.bikeoff.org/tags/presentations/

Risk factors for Misappropriation

Hot Products

- **C**oncealable
- **R**emovable
- **A**vailable
- **V**aluable
- **E**njoyable
- **D**isposable

The dynamics of crime – Modus Operandi

Human Centred MO's

ATM Machine Use

Obtaining PIN Number

Remote Observation

Shoulder Surfing

Obtaining Card – Distraction

Distraction using other money

Distraction by spillage on victim

Victim distracted by being bumped into – Tag Team technique

Obtaining Card and/or Cash – Acquisition

Taking cash and/or card from machine while victim distracted

Bag dipped for cash and/or card while victim distracted

Victim robbed using threats or force for cash and/or card

Capturing dynamics of crime events – Scripts

- In situations which people repeatedly encounter – eg getting cash out of an ATM – they learn which actions work best
- Result of this learning is a cognitive **script** – a structured sequence of things to **attend to**, and things to **do/avoid**, in achieving some **purpose** or **goal**
- Scripts may be associated with particular **roles** – with crime, these roles are **offenders, preventers, promoters**
- A **user/preventer** script:

Find ATM, get out card, use card/ATM, recover card, take cash, leave

- An **abuser/offender** script:

Find ATM, find ambush site, await ATM user with money in hand, snatch money, flee

Script *clashes* – the pivots of design

- Offenders and users may have conflicting goals, causing tactical **script clashes**:
 - Surveill v conceal
 - Exclude v permit entry
 - Wield force v resist it
 - Conceal criminal intent v detect criminal intent
 - Challenge suspect v give plausible response
 - Surprise/ambush v warning
 - Trap v elude
 - Pursue v escape...
- Designers' task is to arrange the situation
 - to favour the user over the abuser in each of these tactical clashes in terms of the shifting dynamics of risk of harm, effort, reward – so the story ends with the bad guy losing! Alternatively,
 - to arrange the wider environment to avoid the clashes happening at all

Gearing up against crime – A dynamic strategy for arms races

- Encourage variety
- Design to performance standards/ generic principles
- Study offender resources – current and future
- Exploit new technology for prevention
- Avoid rigidity and lock-in
- Future proofing
- Pipelines
- Learn from other **evolutionary struggles**

Learning from other struggles

- Military
- Predator-prey
- Pest-farmer
- Bacteria-antibiotic
- Immune system-virus

Boosting inventiveness to cut crime whilst respecting the tradeoffs

- **TRIZ** – a theory of inventive principles
- Based on analysis of **oodles** of patents
- 40 generic **Inventive Principles**
 - Including the comb-over?
- 39 **Contradiction Principles** – the sharper-expressed the contradiction, the easier the problem to solve...link to troublesome tradeoffs and the fundamental contradiction at the heart of crime prevention (user-friendly, abuser-unfriendly)
- **Lookup tables** – what inventive principles solved what contradictions in past?
- Analysis of **evolutionary trends** of invention (solid > segmented > flexible > field) – look for what's likely to be next to limit search for next solution

Describing designed interventions – *Security Function Framework*

- Purpose

What crime problem/s does the design address?

- Niche

How does the design fit within the ecology of security?

- Mechanism

How does the design work in preventing crime?

- Technology

How is the design realised through materials, construction and operation?

Case study – the Stop Thief Chair

Stop Thief Chair – Security Function Statement

Purpose

- *Principal* purpose to serve as a fully functional chair
- Subsidiary purpose to reduce risk of *theft* of *customers' bags* in *bars and restaurants*
- *Desire requirements* – stylish, economical, protects reputation of venue as safe, caring place
- *Hygiene requirements* – physically safe, sustainable

Security niche

- A *securing* product

Stop Thief Chair – Security Function Statement

Mechanism

- Supplies physical *anchorage* of target bag, that is differentially easier to release by bag-user
- Mobilises people to *use the security function of the chair*, and consequent *surveillance and reaction*
- Protects bag within user's 'personal defensible space'
- *Deters* through increasing offender's perception of risk of being detected and caught in the act

Technicality

- *Twin notch feature* cut in leading edge of seat, over which the bag handle is placed
- Bag then anchored by its handle being enclosed between seat and back of user's knees

The ExRes Railway Carriage Counterterrorism design security function spec

Purpose

Principal purpose

- To serve as a fully functional and appropriately-adapted railway carriage

Subsidiary purpose

- Minimise passenger injuries from explosives detonated either inside or outside of the carriage

Desire requirements

- For *Train Operating Companies*, desire requirements include
 - Economical
 - Easy to clean/maintain
 - Does not scream ‘terrorist risk’ (hence ‘tidy and safety’ purposes)
 - Fits décor
 - Satisfies societal hygiene functions to meet obligations/regulations

Desire requirements

- For *customers*, desire requirements include
 - Attractive, comfortable, reassuring
 - Easy to use
 - No risk of injury or damage to clothing
 - No looking uncool or embarrassed about concern with security
 - No risk of forgetting bag on departure from carriage

Hygiene requirements

- For *Society*, hygiene requirements include
 - Health and safety – doesn't jeopardise crashworthiness
 - Sustainability – low carbon in production
 - Inclusiveness
 - Economy/cost-effectiveness – supports affordable social benefit of rail

Niche

- ExRes is a *securing* product: its security function is subsidiary to its principal purpose as a conveyance
- As an asset to be protected in itself it is also
 - A *secured* product – protected by wider railway security procedures
 - A *secure product* – *resisting damage to itself*

Mechanisms

The security function of ExRes is to be realised by

1. Minimising the number of forgotten items
2. Maximising the surveillability of the carriage
3. Increasing the offender's perception of the probability of being caught
4. Preventing injuries from fragments
5. Absorbing the blast energy from explosives detonated internally
6. Strengthening the carriage structure such that it can withstand an externally generated blast and thus minimise passenger injuries

From Mechanisms to Technicality

Mechanisms

1. Minimizing forgotten items
2. Maximizing surveillability of carriage
3. Increasing offender's perception of probability of being caught
4. Preventing injuries from fragments
5. Absorbing blast energy from explosives detonated internally
6. Ensuring carriage structure withstands externally generated blast and thus minimizes passenger injuries

Technically realised e.g. by

1. Minimizing storage areas
2. Removing unnecessary clutter and only including interior that does not hinder sight more than necessary
3. Installing CCTV at entrances
4. Only including interiors that resist fragmentation and fire
5. Ensuring rapid and sufficient ventilation of explosive gases
6. Strengthening carriage walls and floors with interior detached ribs

CT bin – Security Function Statement

- **Purpose**

- Principal **purpose** – a functional and serviceable trash bin for use in public spaces in railway stations
- **Subsidiary purpose** – minimizing the misuse of the bin for the concealment and detonation of an explosive device
- **Auxiliary purpose** facilitating verification and efficient management of security threats (including false alarms) related to trash bins.

- **Niche**

- Primary niche – a securing product
- Additional security niche – facilitating security management

- **Mechanism**

- For **securing niche** – features to limit size of objects that can be placed in bin and features that facilitate monitoring and identification of objects in bin by staff and public
- For **security management** niche - features to facilitate efficient use of robot bomb disposal and X-ray equipment

- **Technicality**

- Small 12-cm aperture for depositing trash; bin materials and dimensions that allow visual access of bin contents, promote maintenance, and control access; and, at rear of the bin, a secure purpose-designed slot for an X-ray slide.

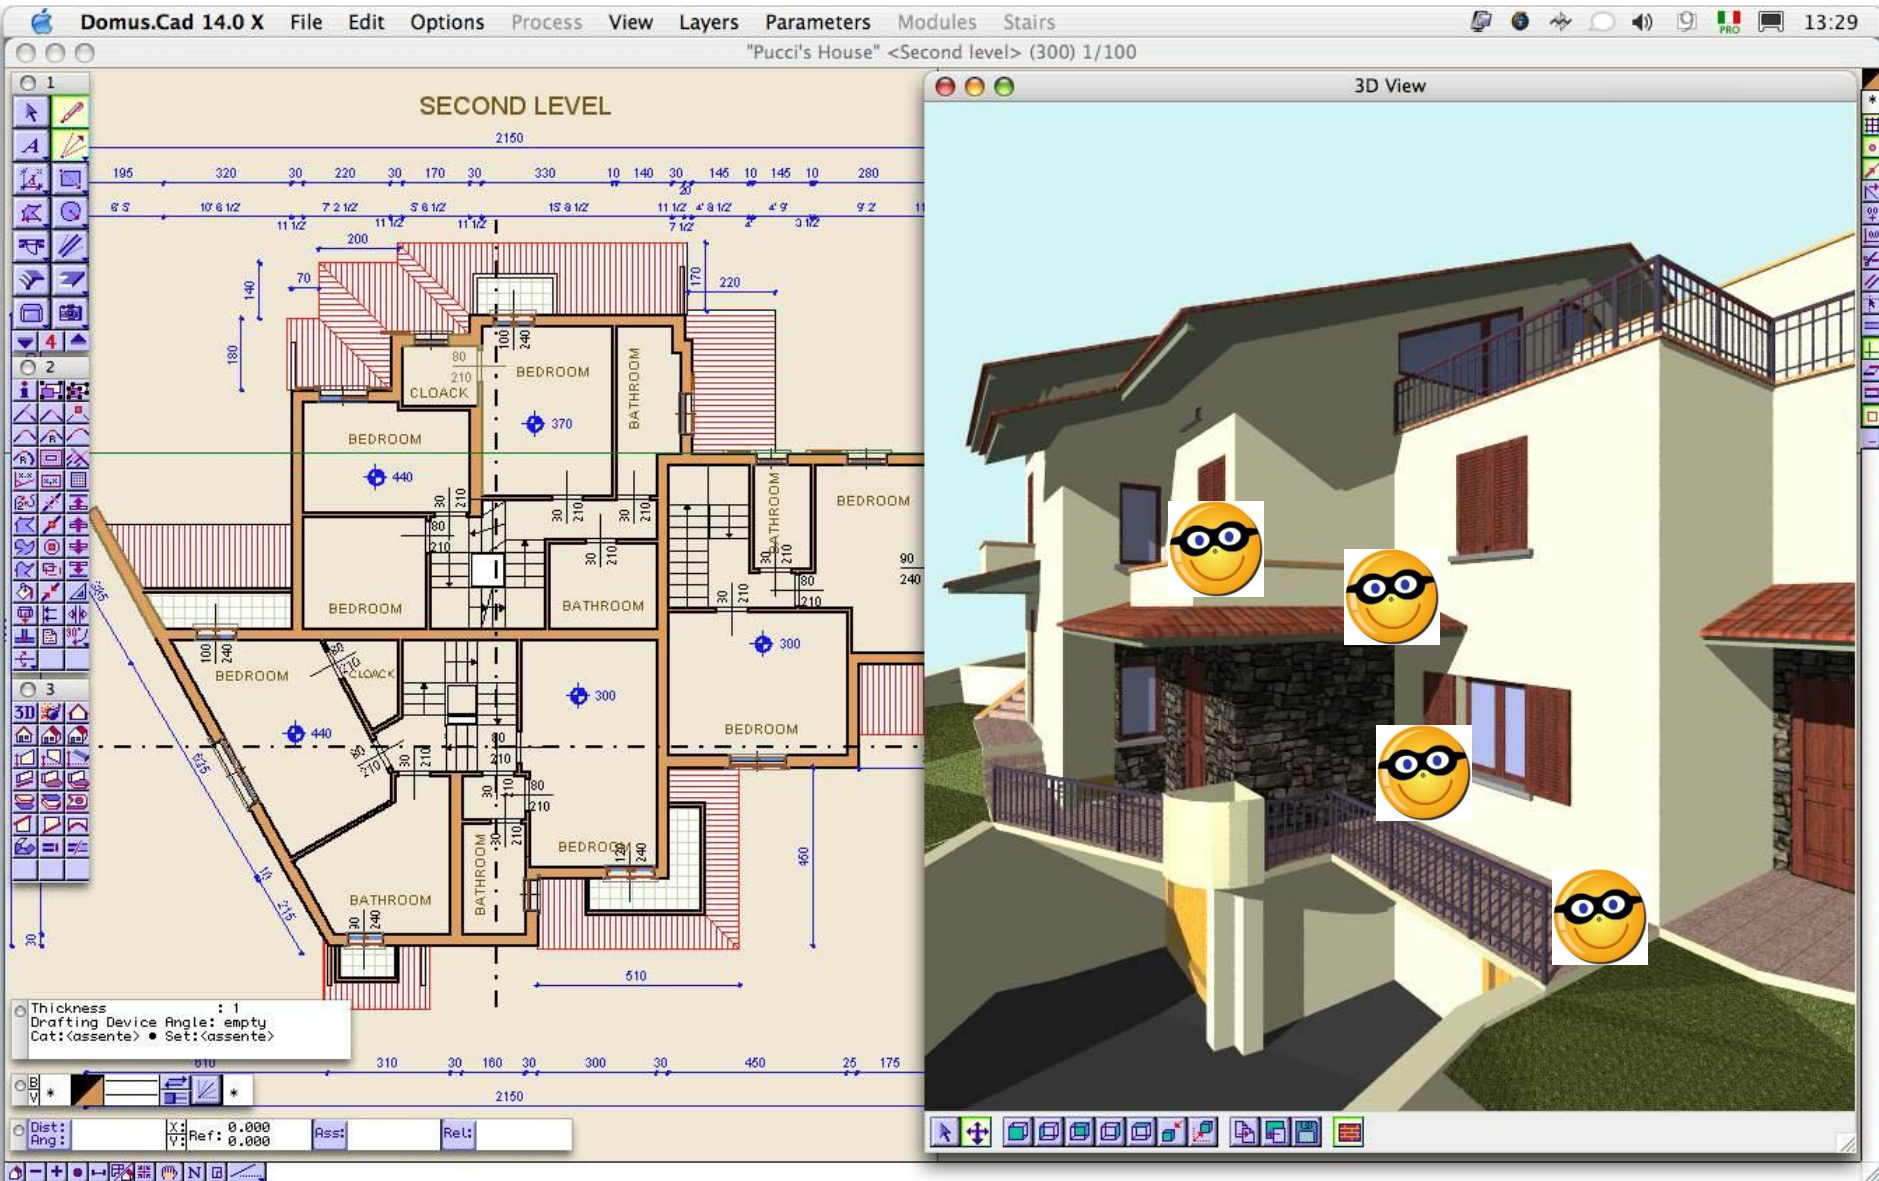

SFF – issues

- These 4 levels of the Security Function Framework resemble a structured **patent claim** – *Purpose served through security niche by mechanism realised by technology* – albeit patents also have diagrams
- SFF can be used not just to describe what's been done, as with the Stop Thief Chair, but prospectively, as with Ex-Res carriage; seems capable of handling significant as well as relatively minor security issues
- Can apply to all crime prevention, not just that delivered through design of products/places
- Fully set out in forthcoming book (early 2012) **Design Against Crime: Crime Proofing Everyday Objects** **Crime Prevention Studies 27**. Boulder, Col: Lynne Rienner

Technology of design visualisation –

**Helping designers, clients and users
with virtual reality design aids**

Computer aided design

Virtual Reality for lighting design

- Enables designers to visualise lighting before implementation
- Provides a means of communicating design ideas to different interest groups

Importance of process knowledge – throwing away the cookbook

- Crime prevention requires practitioners to
 - Be adaptable, subtle, alert to tradeoffs – customising the response to context, and creating and configuring plausible proposals for new circumstances
 - Replication is innovation
 - Handle uncertainty and lack of complete knowledge of what works
 - Anticipate & allow for change
- This needs practitioners more like expert consultants than technicians

Horizon Scanning

- **Forecasting future trends, developments and events**
- **Broad sweep of sources for issues that may impact on**
 - **Policy, Delivery, Practice and Public affairs**
- **Covers the short (2 years), medium (2-5 years) & long term (5-10+ yrs)**
- **Considers changes in Social, Technological, Economic, Environmental, Political), Organisational, Legal fields – and interactions between them**
- **Makes plausible forecasts backed by evidence, theory and logic – inexact but not wild guesses or fringe ideas**
- **Helps manage a range of risks and opportunities – ‘futures thinking’, not ‘predicting a specific future’**

CRIME REDUCTION & COMMUNITY SAFETY

- New technology/ business models, economic changes >
- New opportunities, targets/ tools for crime – especially cybercrime;
- New opportunities for crime reduction & community safety
- False alarms/nuisance

CHANGE UNINTENDED CONSEQUENCES THREATS OPPORTUNITIES

Linking forecasts of background trends & events to CDR & CS policy, delivery, practice and performance
