

# National Vehicle Crime Working Group, Horizon Scanning Workstream: A Palette for Horizon-Scanning?

V1 19-07-21

Paul Ekblom

UCL Dawes Centre for Future Crime

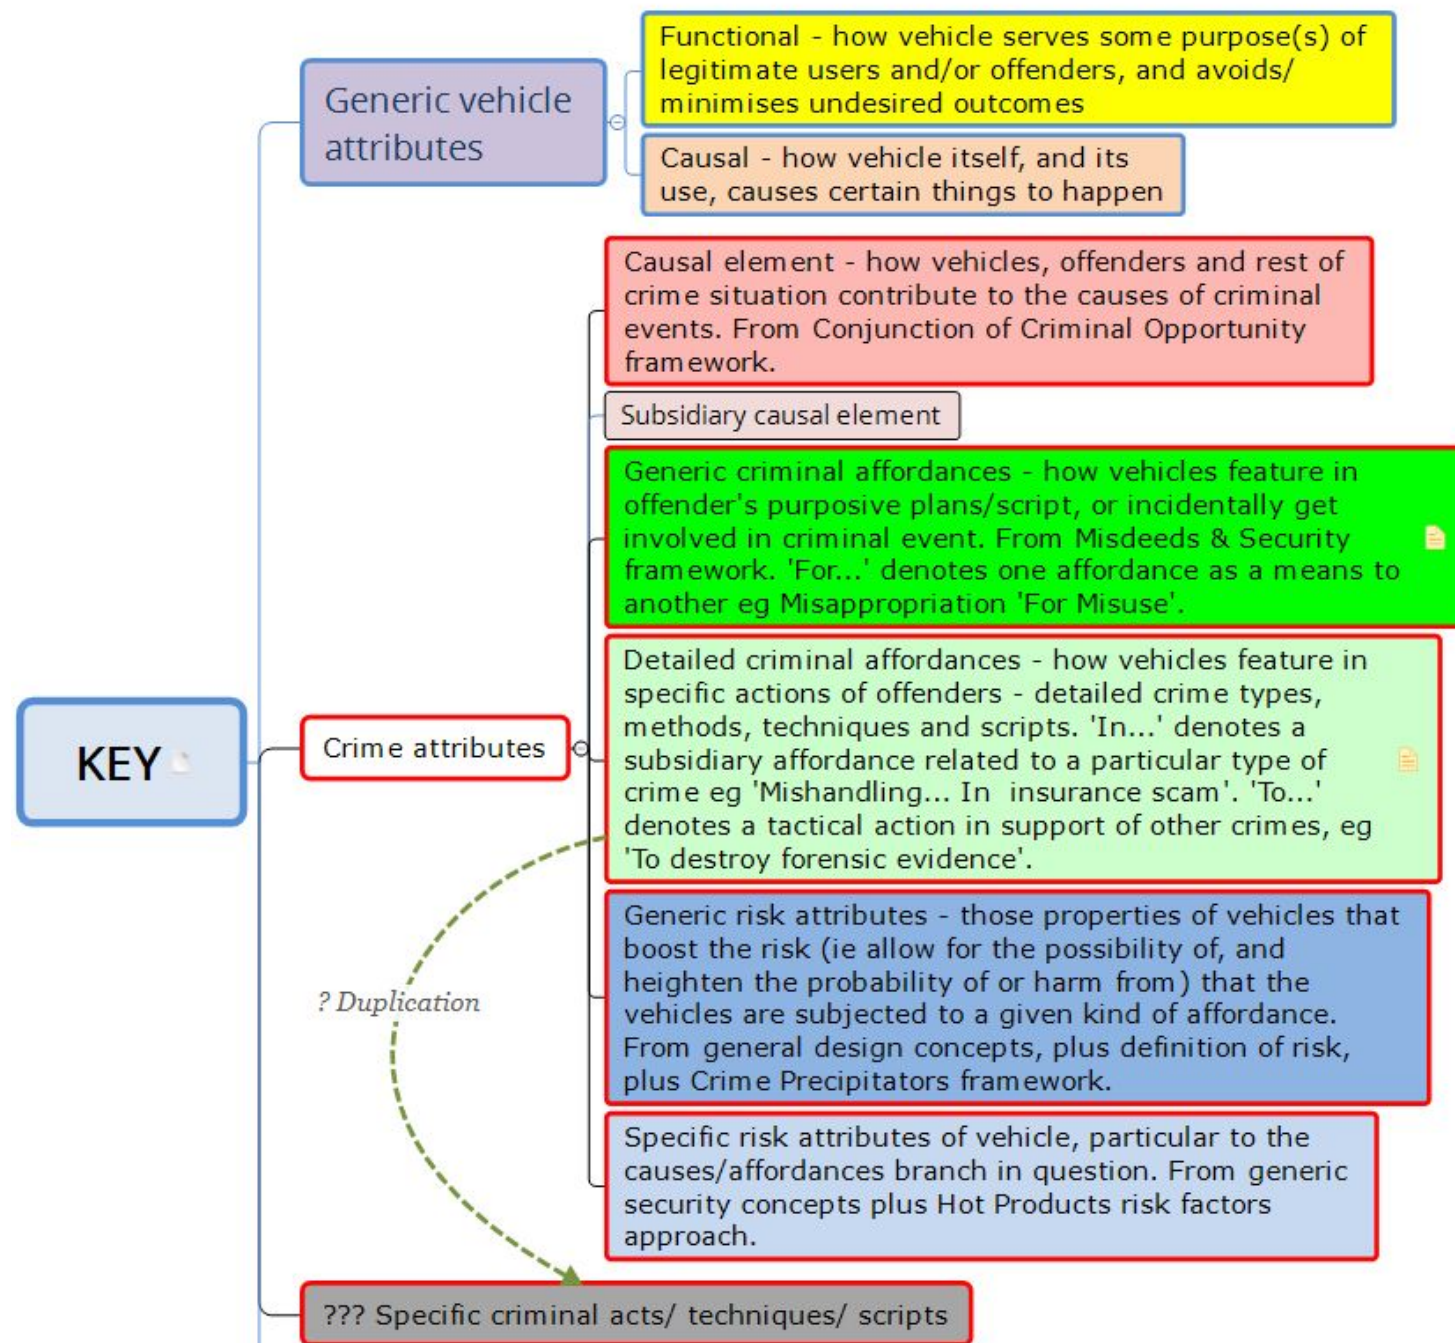

# Introduction 1

- Scenario development is a major tool in the Horizon-Scanning repertoire. Yet developing scenarios is a highly intuitive affair, despite attempts to provide systematic structure such as the ‘axes of uncertainty’ approach or the more advanced ‘morphological analysis’ which uses domain experts to generate multiple dimensions/variables and then filter down to the most significant ones. I have been attempting to develop a related approach to the latter, but rather than relying on expert consensus, the dimensions/variables of the structure are built up by combining a number of theoretical frameworks that I and others have developed within crime prevention/ security. All this extends the approach in my chapter on product design in the ECCA handbook, and ideas developed in the UCL Dawes Centre Masters module on crime/security horizon-scanning.
- The frameworks/perspectives I draw on include the following.
  - Familiar ones from Situational Crime Prevention, e.g. Rational Choice, Routine Activities, Crime Scripts, Situational Precipitators, and Risk Factors e.g. Hot Products.
  - My own developments of these including the Conjunction of Criminal Opportunity (integrating the common situational approaches plus richer coverage of the offender’s motivation, perception and goals), and the Misdeeds framework (basic criminal affordances as they relate to things like vehicles – e.g. Misappropriate or steal, Mistreat or damage, Misuse as tool or weapon).
  - Various design-related approaches, covering generic affordances and other requirements centring on vehicles, what we use them for and what we want to avoid.

# Introduction 2

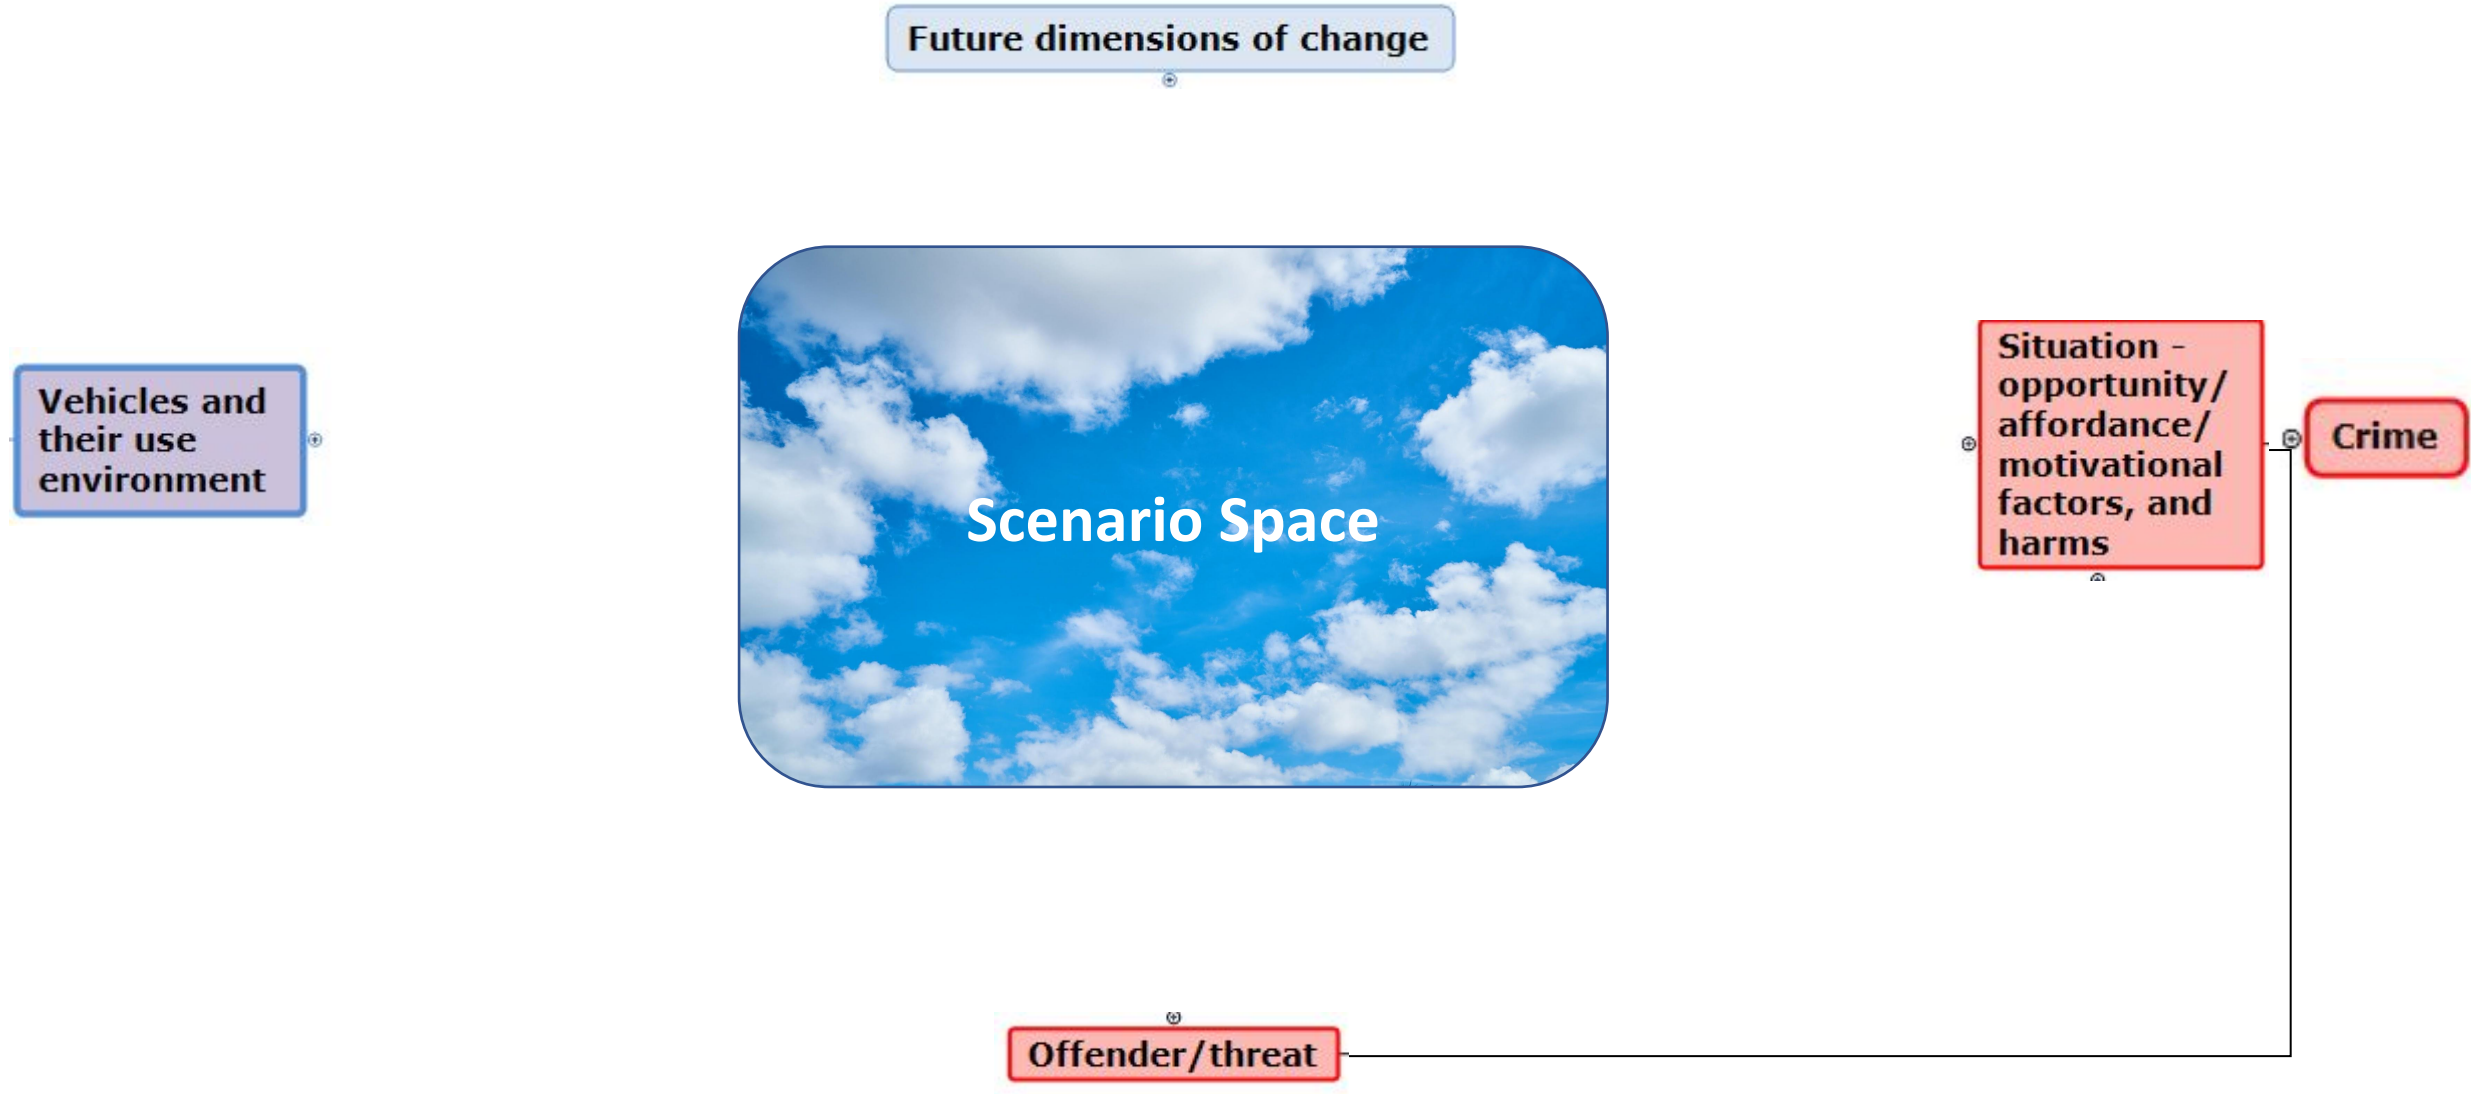

- The palette is currently in graphical form. It's developed in [XMind](#), a basic version of which is freely downloadable (I used v8, but latest is probably back-compatible). It can be exported as pdf or svg, but currently hard to get into expandable/collapsible form in HTML.
- At the moment, the palette is essentially a working space in the centre, with structured prompts on all sides, covering:
  - Vehicle design and the use environment
  - The offender threat
  - Situational risk factors
  - Future changes (across the whole PESTELOMI range)
- It's pretty crude but I think could usefully be developed and turned into some sort of interactive toolkit. More could be added when taking in ideas from the VCWG log.
- This presentation takes you through the 4 different sides in progressive detail. The next slide shows a colour key.
- I haven't yet given much attention to how the palette can be used, but I think this could involve a) focusing on a particular criminal affordance (e.g. Misuse of vehicle in collision insurance scam) and then b) posing a sequence of questions, such as these:
  - How do the vehicle design requirements serve the criminal affordances?
  - How do offender threat factors interact with situational risk factors to generate opportunities, precipitation and harms?
  - How might future changes in the PESTELOMI dimensions affect vehicle design and use, offender threat and situational risk factors, and their interactions?
- At the moment the crime side is fairly well-developed, but not yet the security side. Questions on the interaction between crime and security could include, e.g.:
  - What are the script clashes between offenders and security (or the vehicle users/owners)?
  - How might future changes of various kinds influence these affordances, and tip the balance of these script clashes in favour of one or other side?
- Feedback welcome, e.g. as a commented version of this Powerpoint. Let me know if you want a copy of the Xmind file to play with

# Key

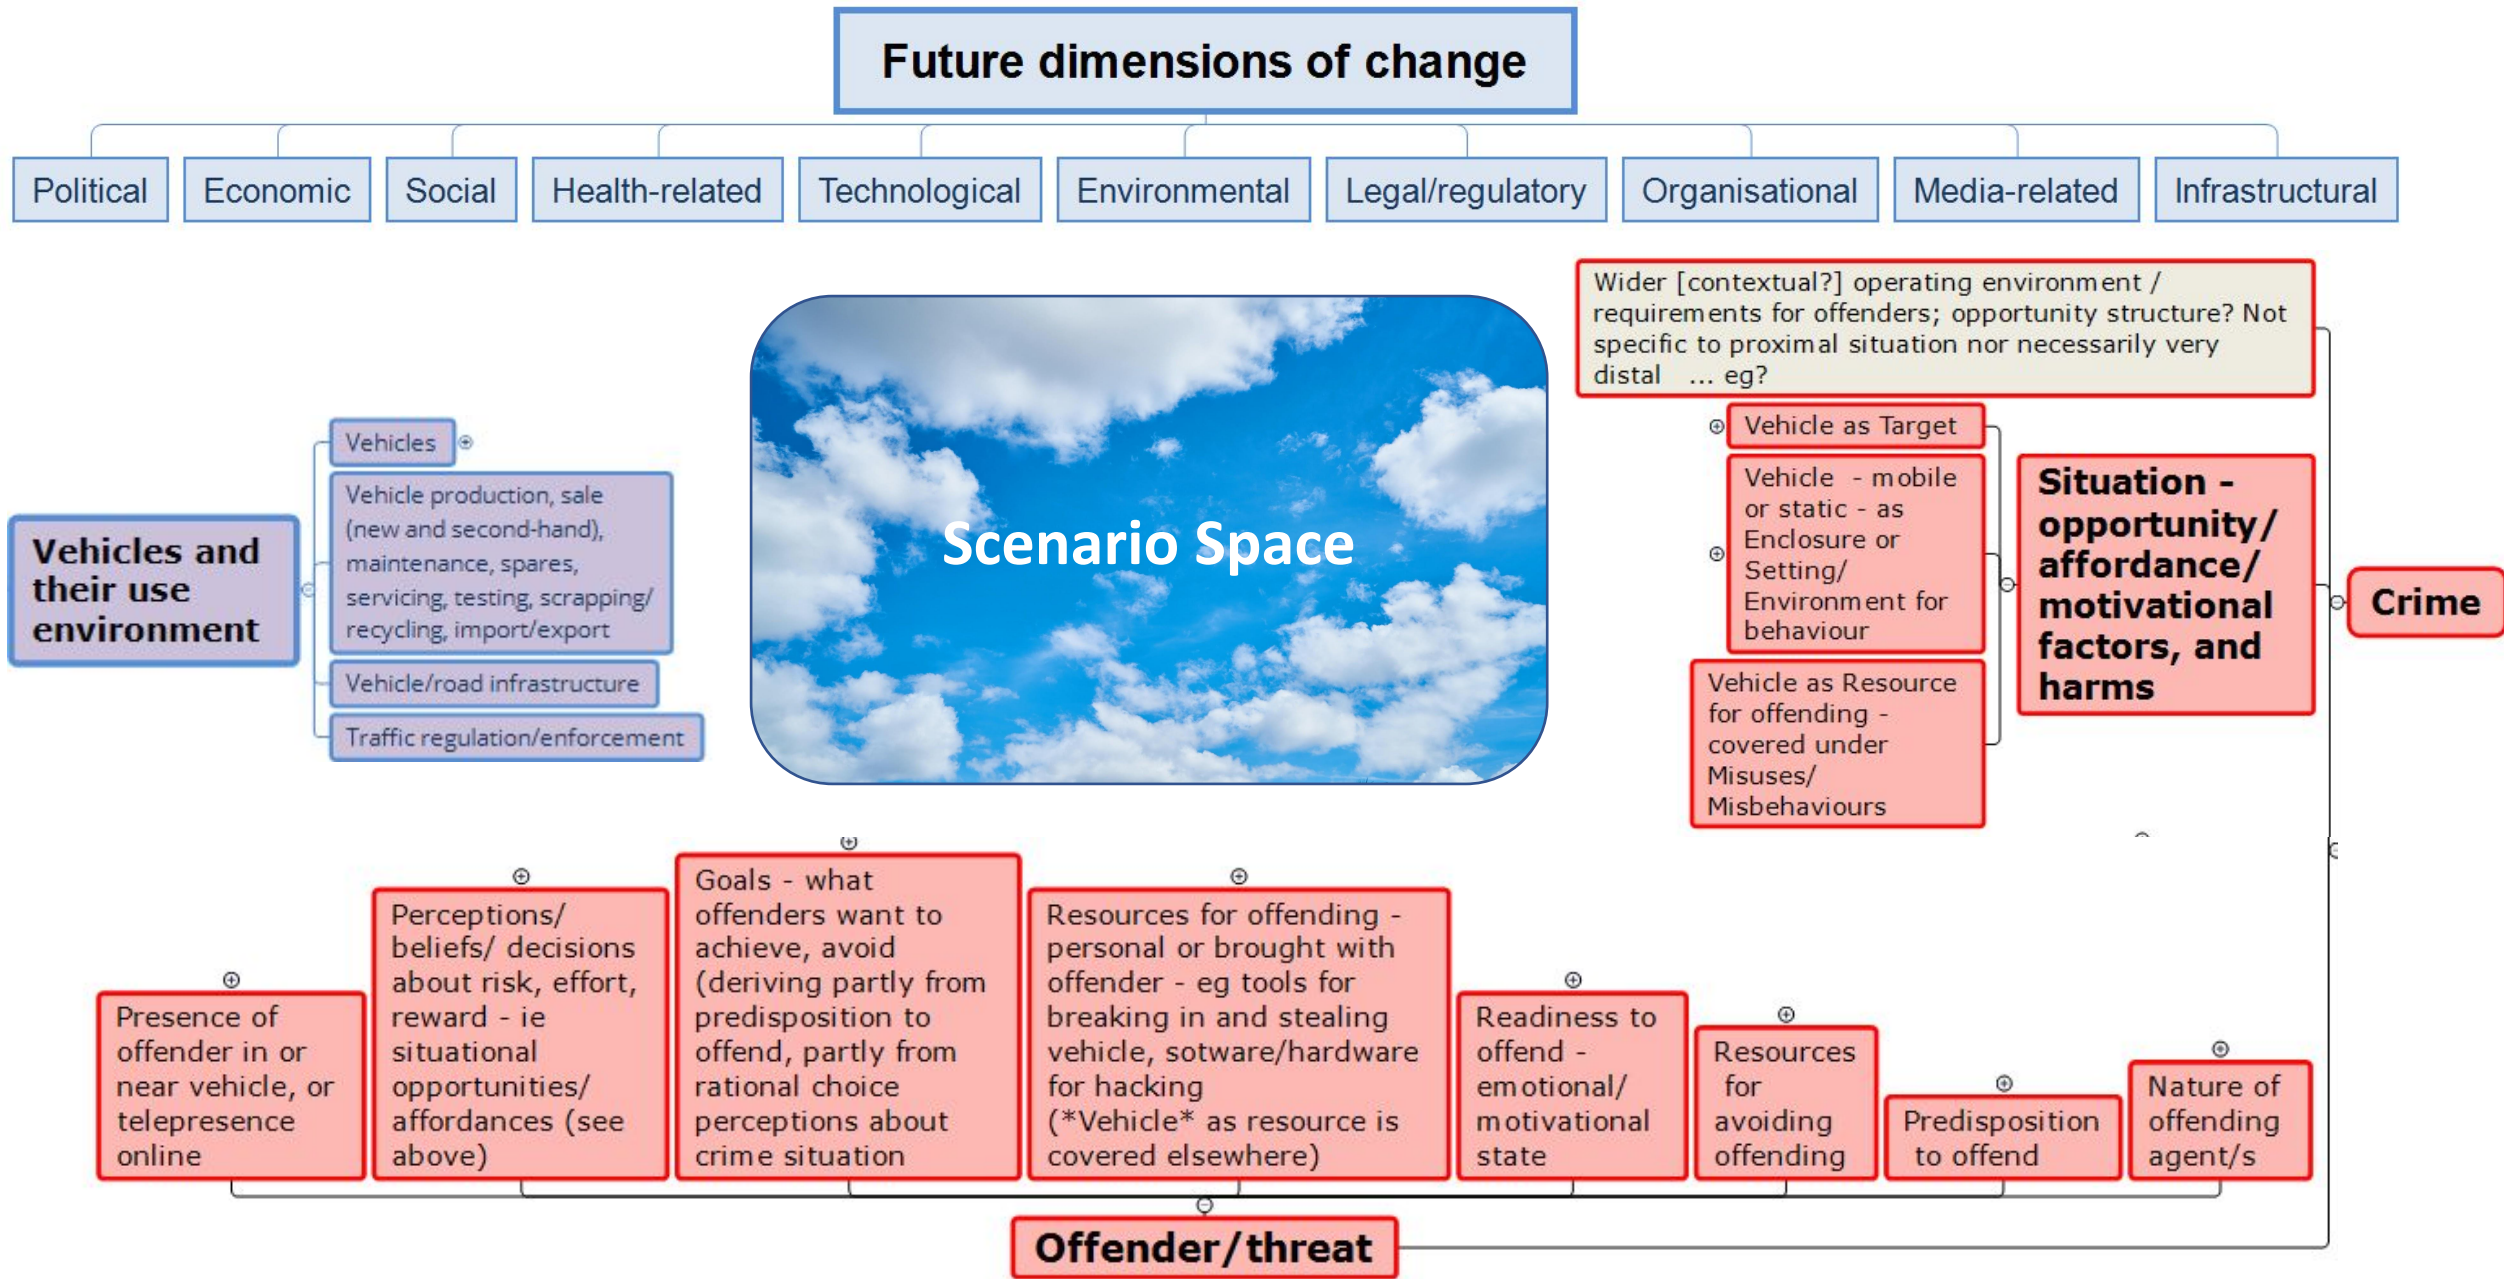

# The four edges of the palette

- Where to put Security?

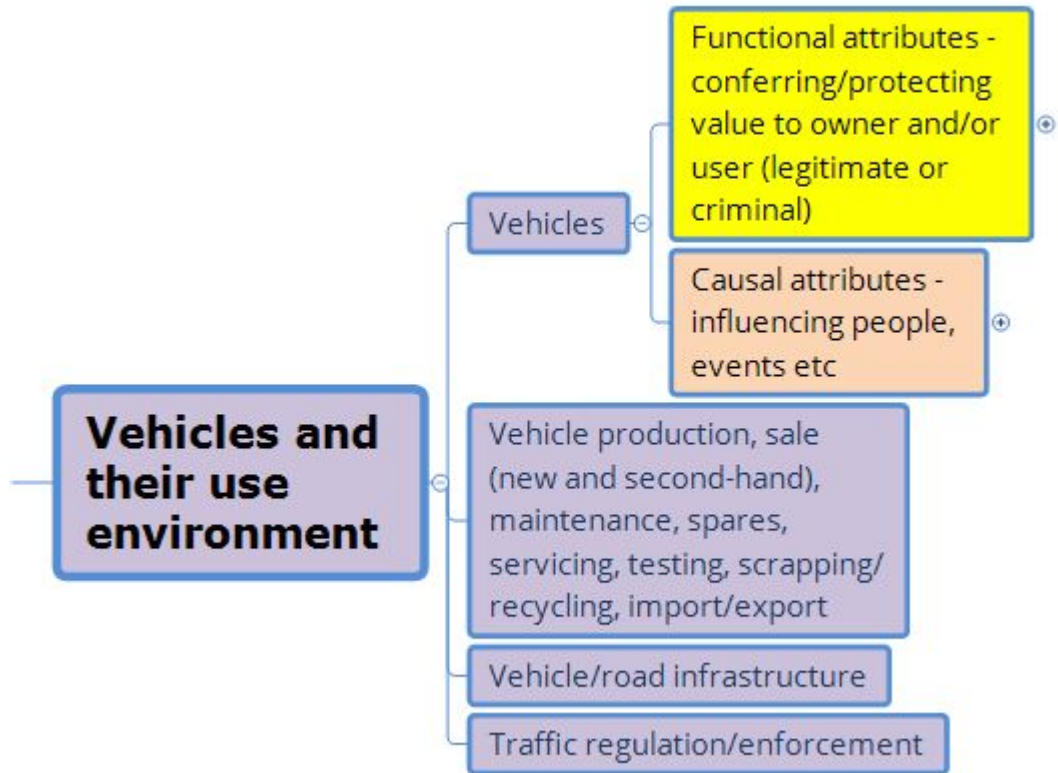

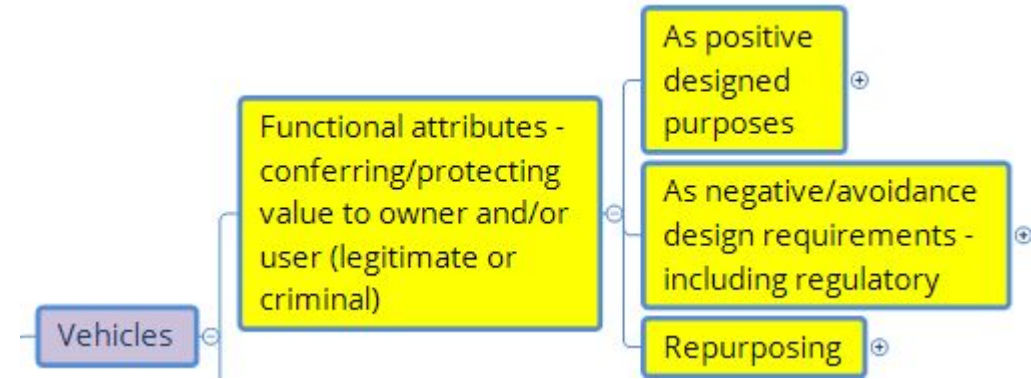

# Edges in more detail

# Vehicles and their use environment

# Vehicles – functional attributes/design requirements

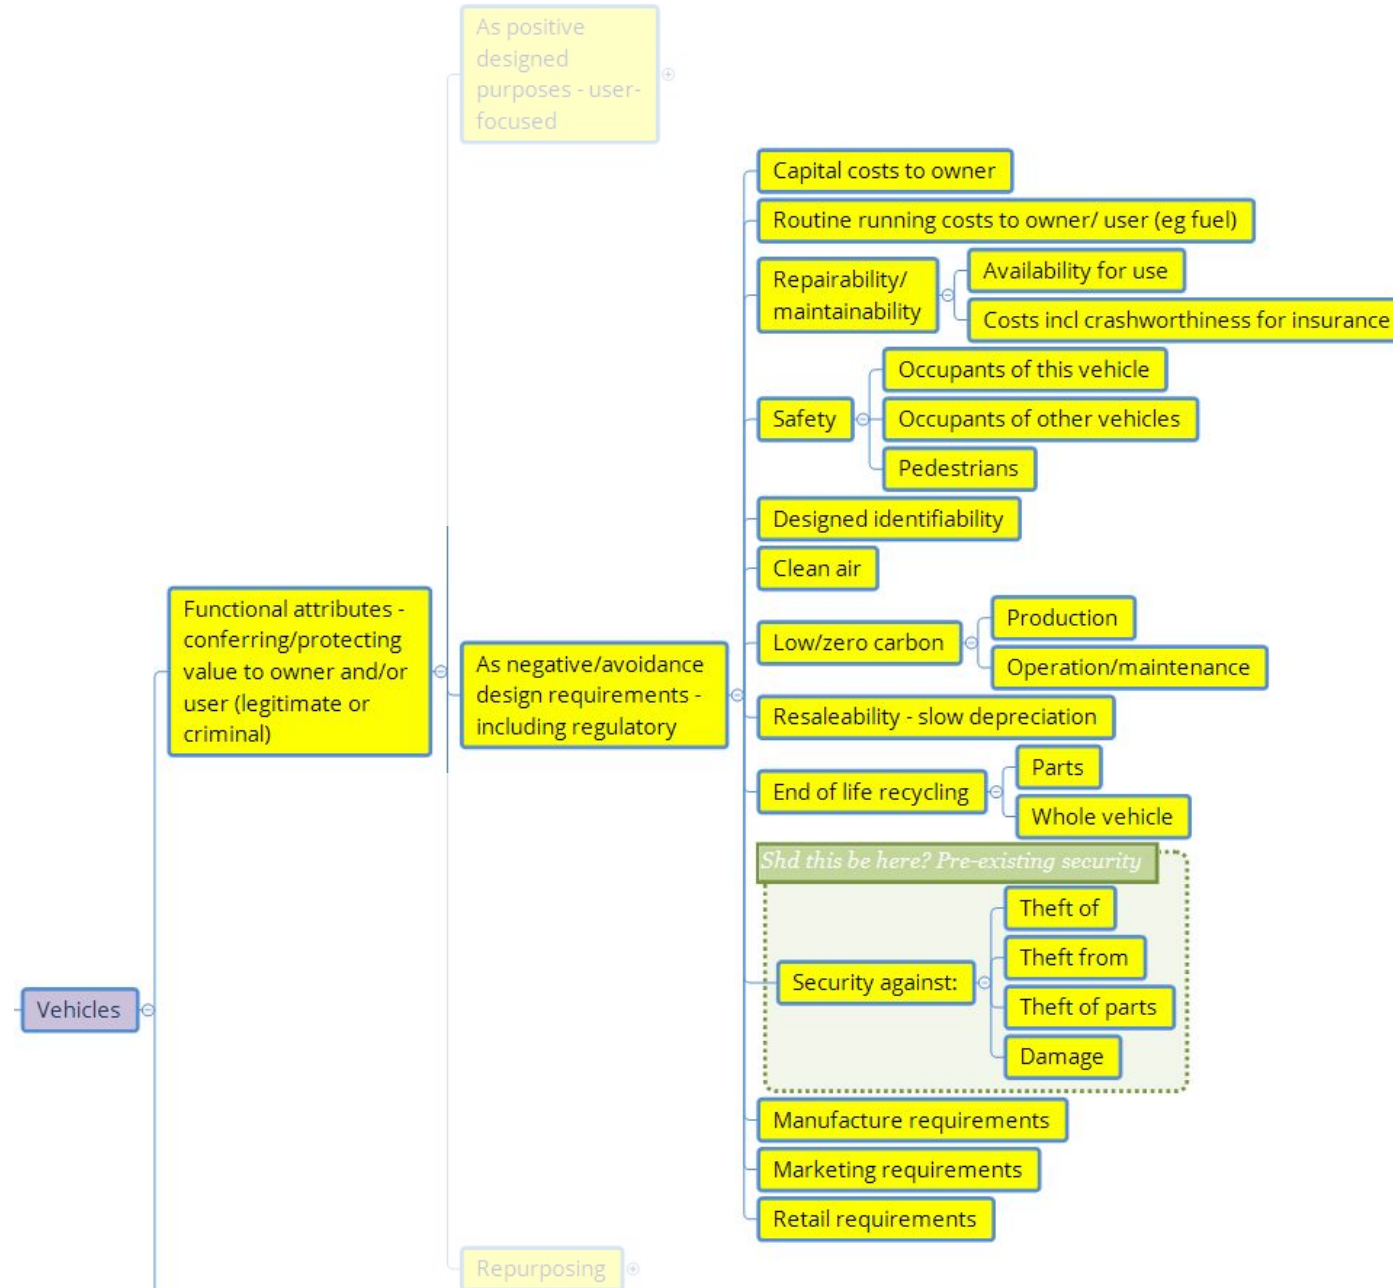

# Vehicles – functional attributes/design requirements

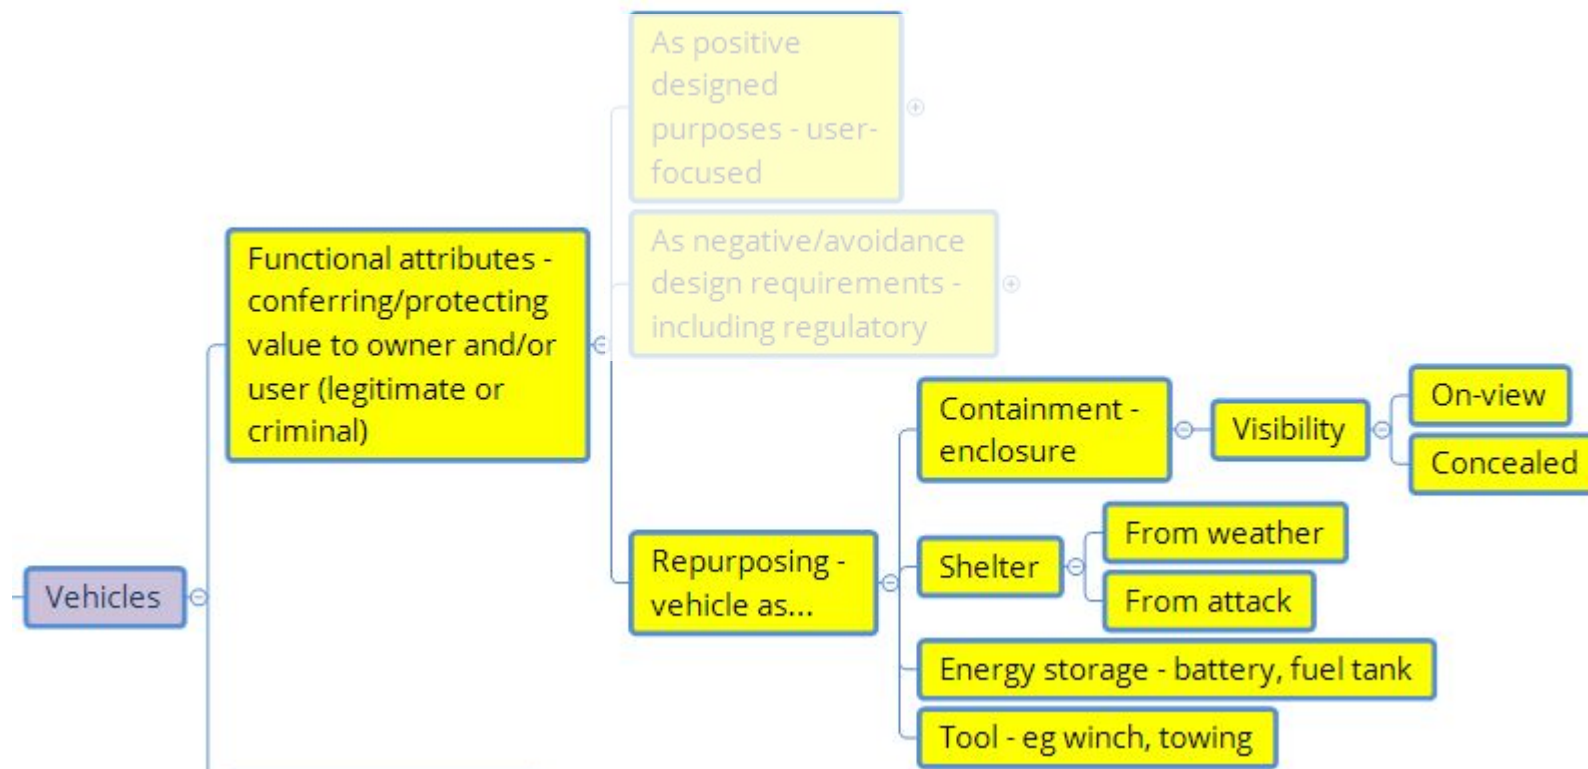

# Vehicles – functional attributes/design requirements – positive design requirements

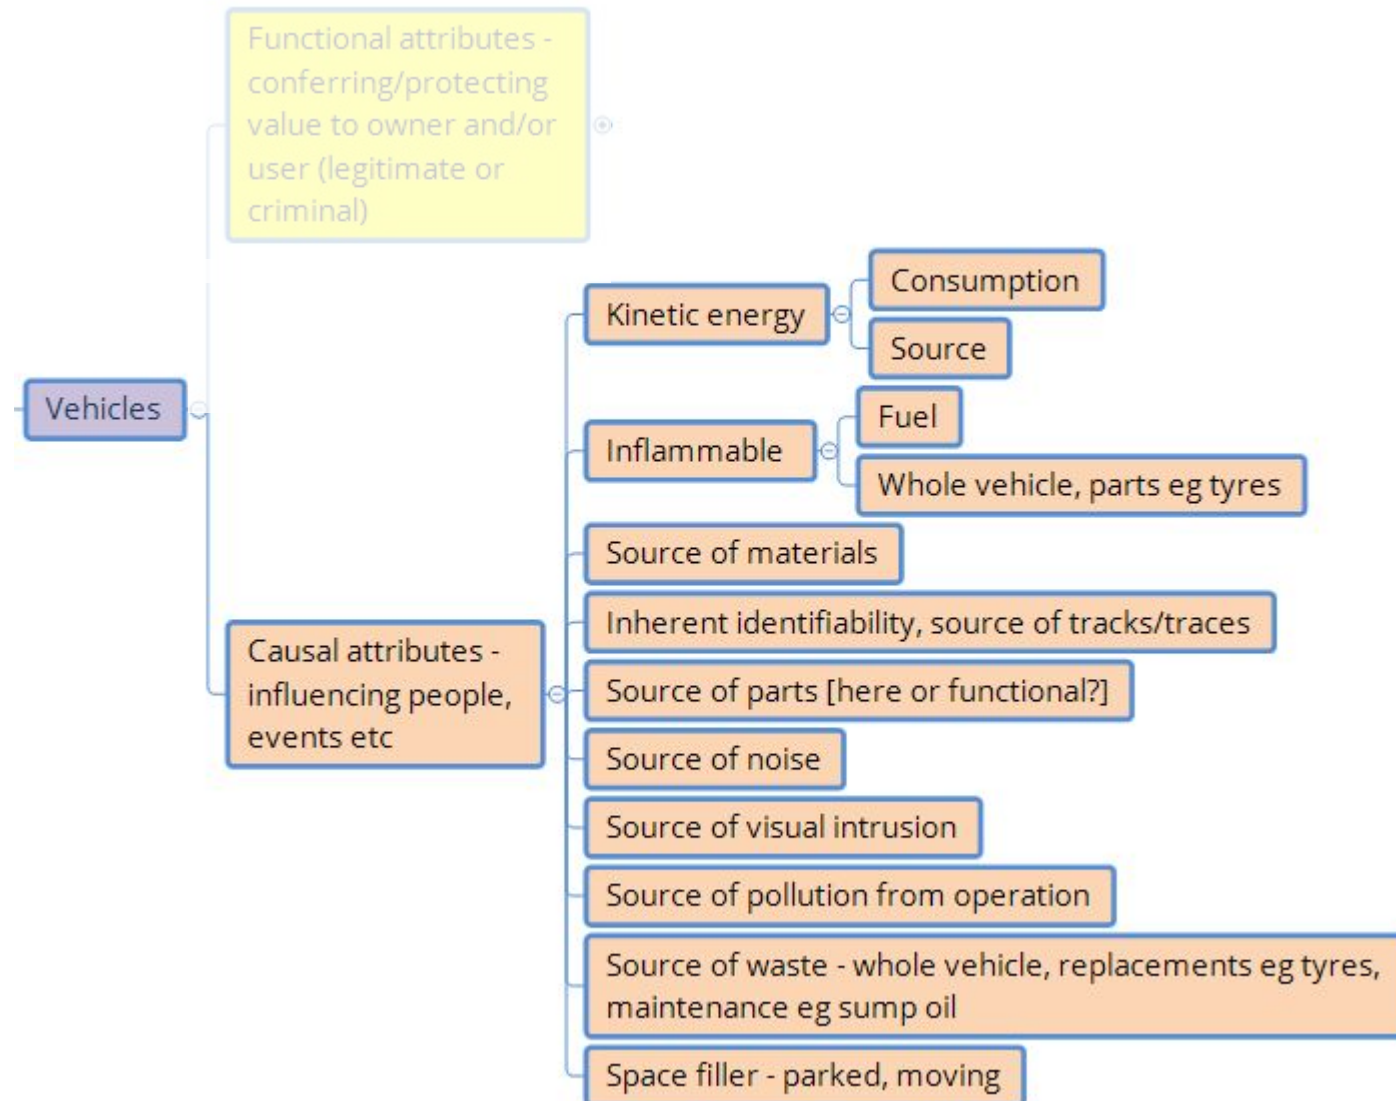

# Vehicles – functional attributes/design requirements – negative/avoidance design requirements

# Vehicles – functional attributes/design requirements – repurposing

# Vehicles – causal attributes

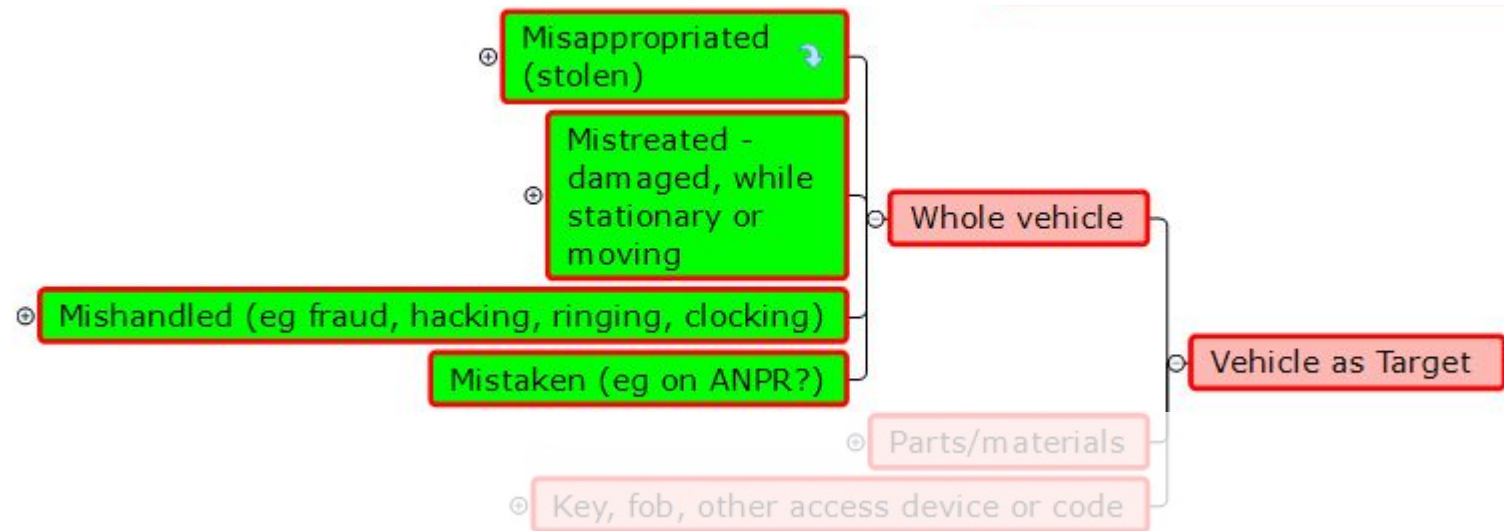

# Crime situation – whole vehicle as target

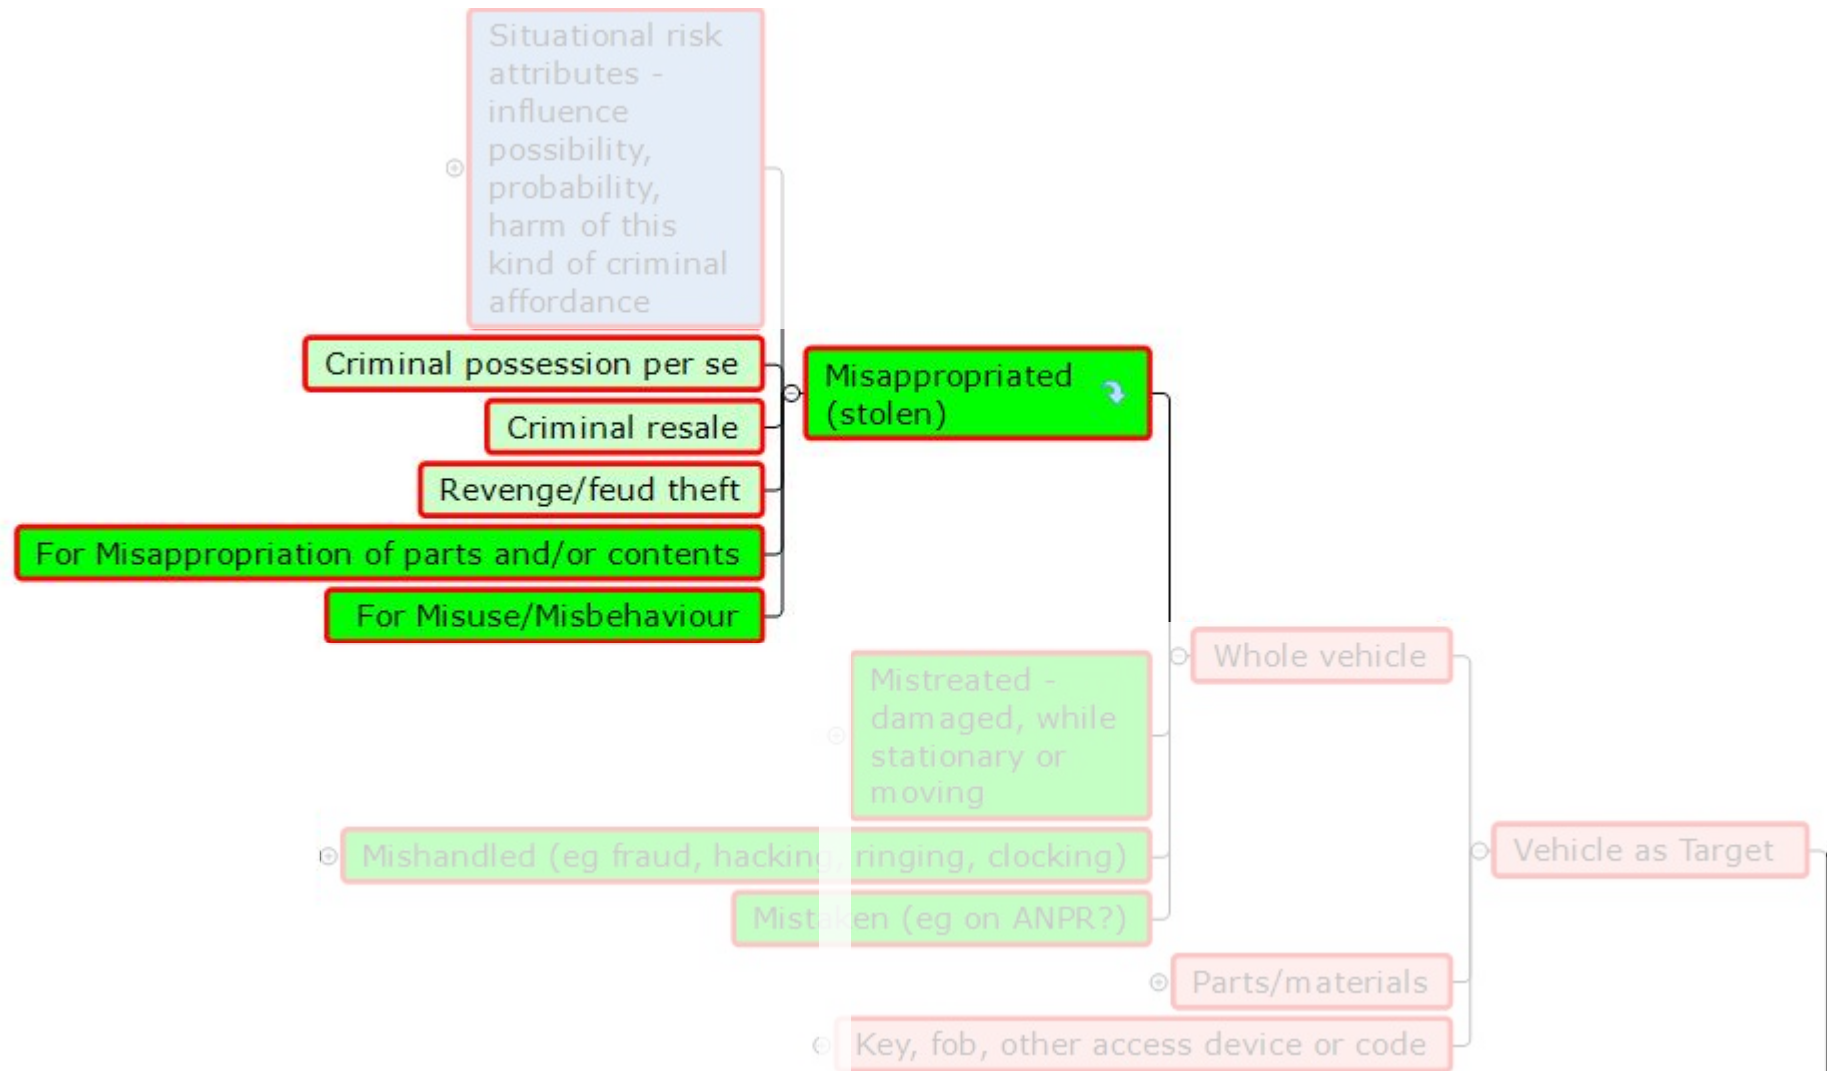

# Crime situation – whole vehicle as target – generic criminal affordances

- This uses the Misdeeds framework

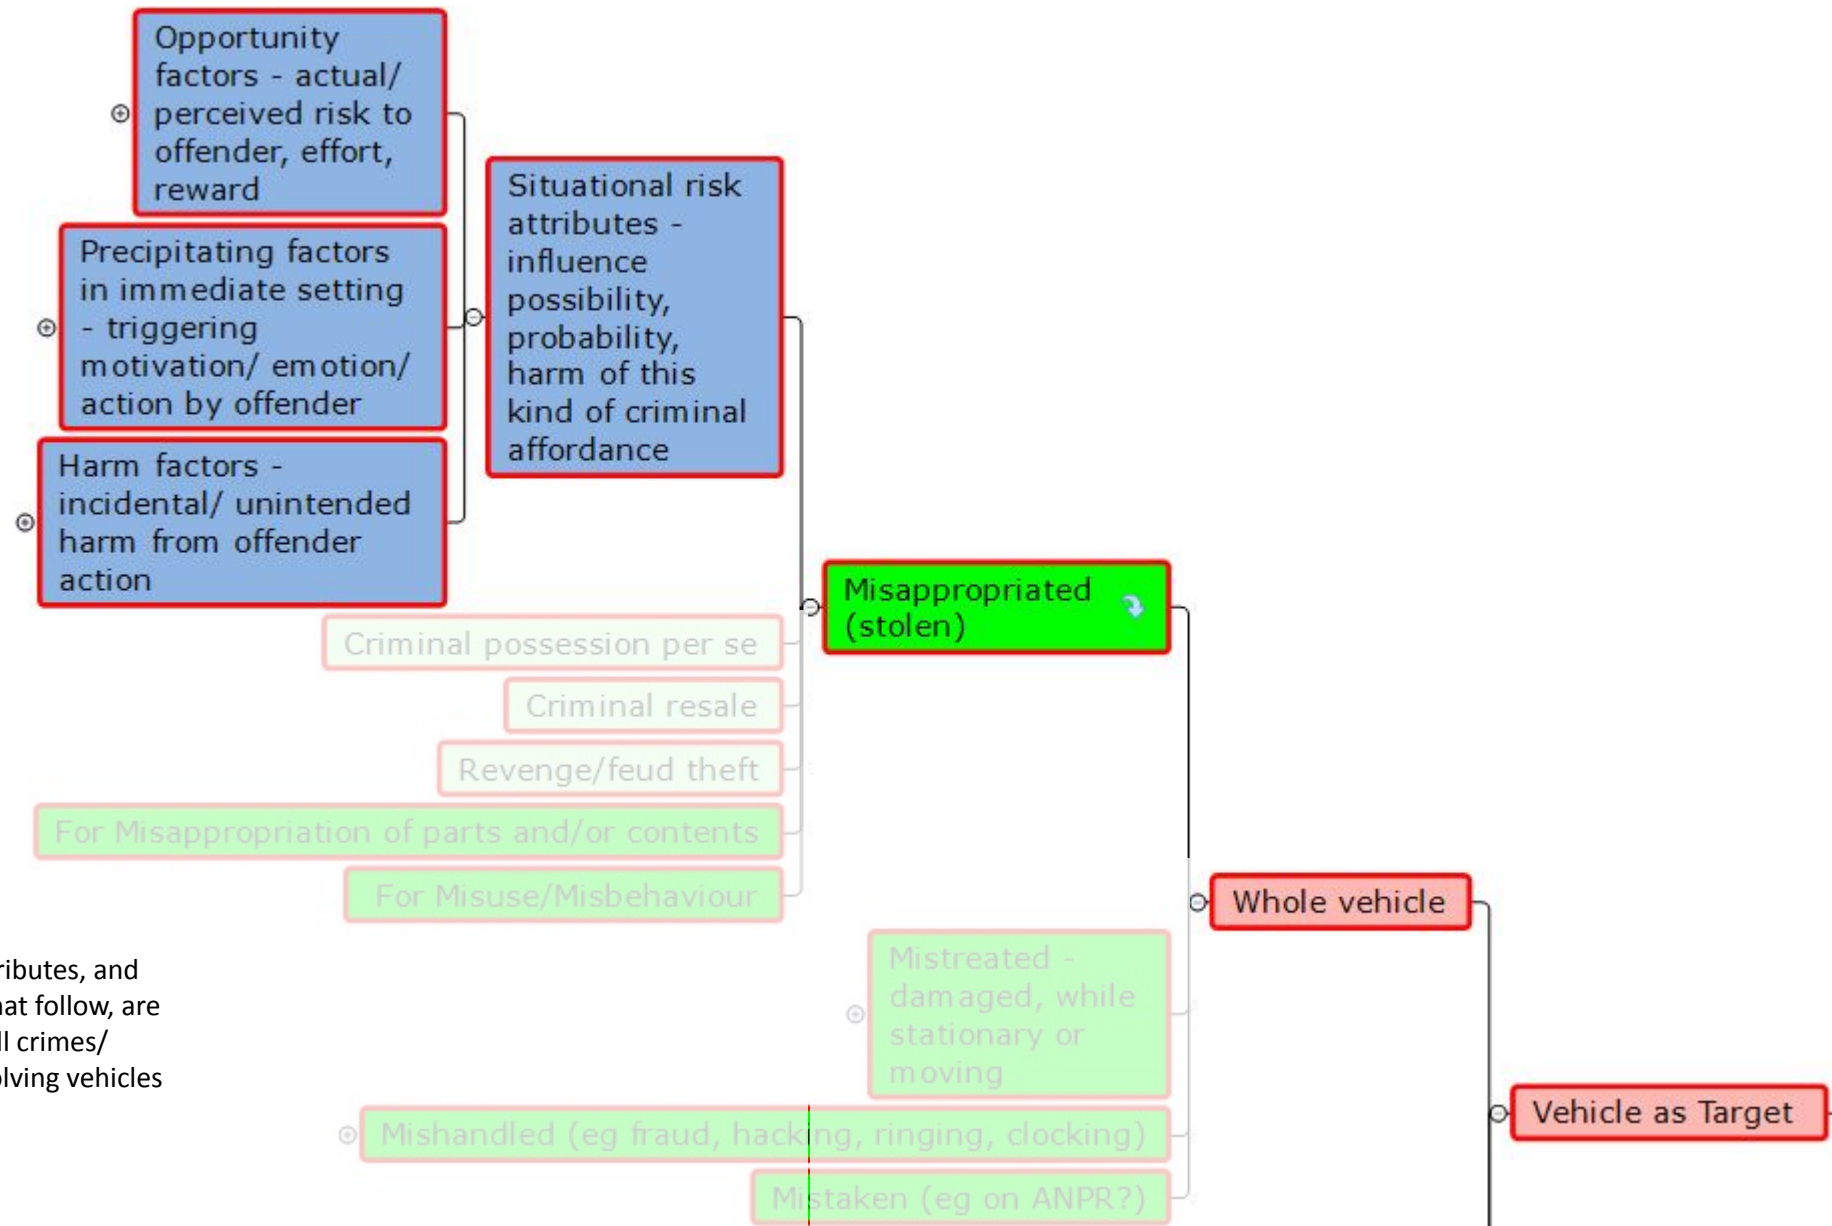

# Crime situation – whole vehicle as target – of misappropriation (theft): detailed affordances, and linked generic affordances

- Linked generic affordances are where, for example, a vehicle can be **misappropriated** in order to **misuse** it (e.g. stolen for use as a getaway car). In effect, these are operational-level steps in a crime script

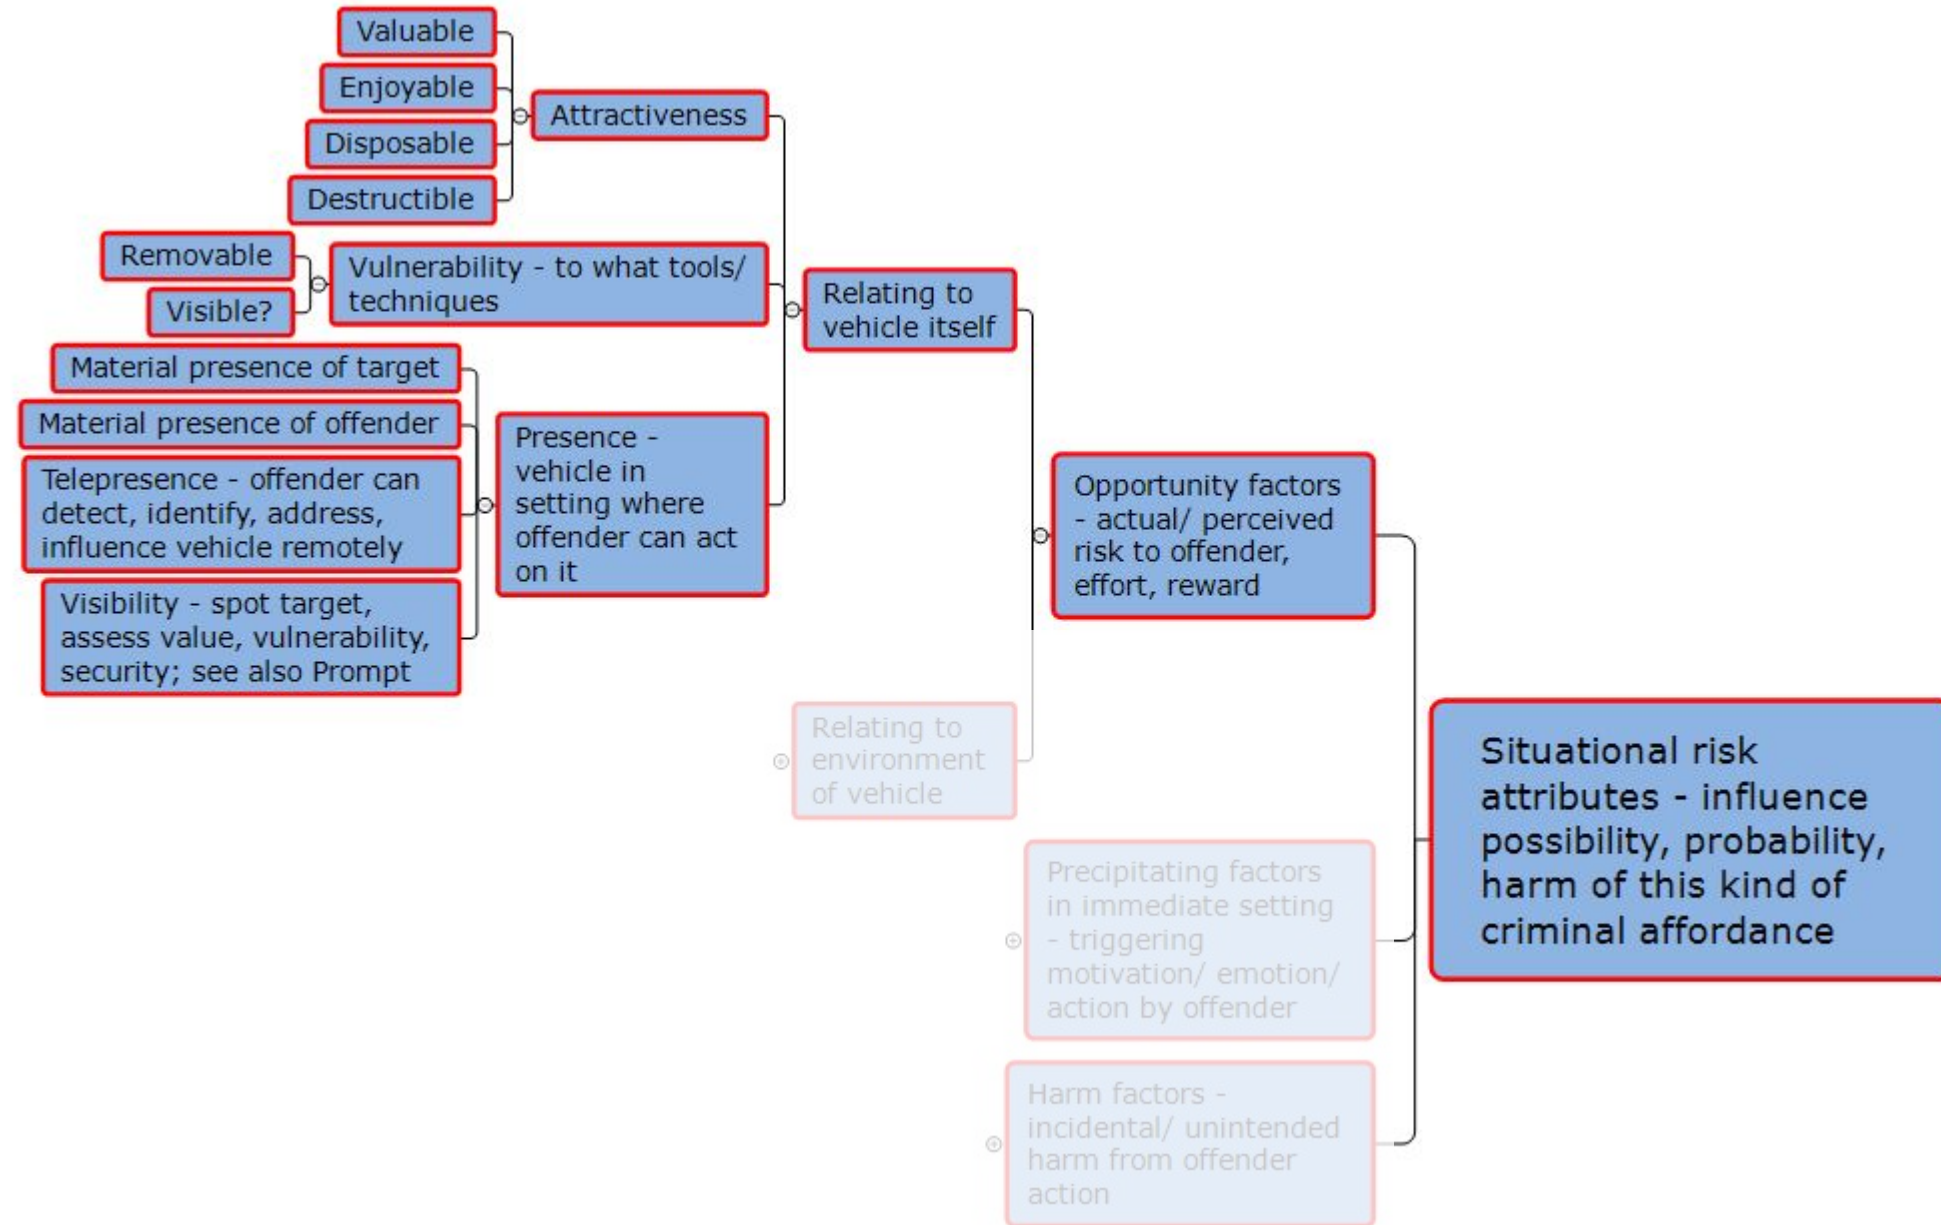

# Crime situation – whole vehicle as target – of misappropriation (theft): situational risk attributes

- These situational risk attributes, and the expanded versions that follow, are generic – they apply to all crimes/ criminal affordances involving vehicles

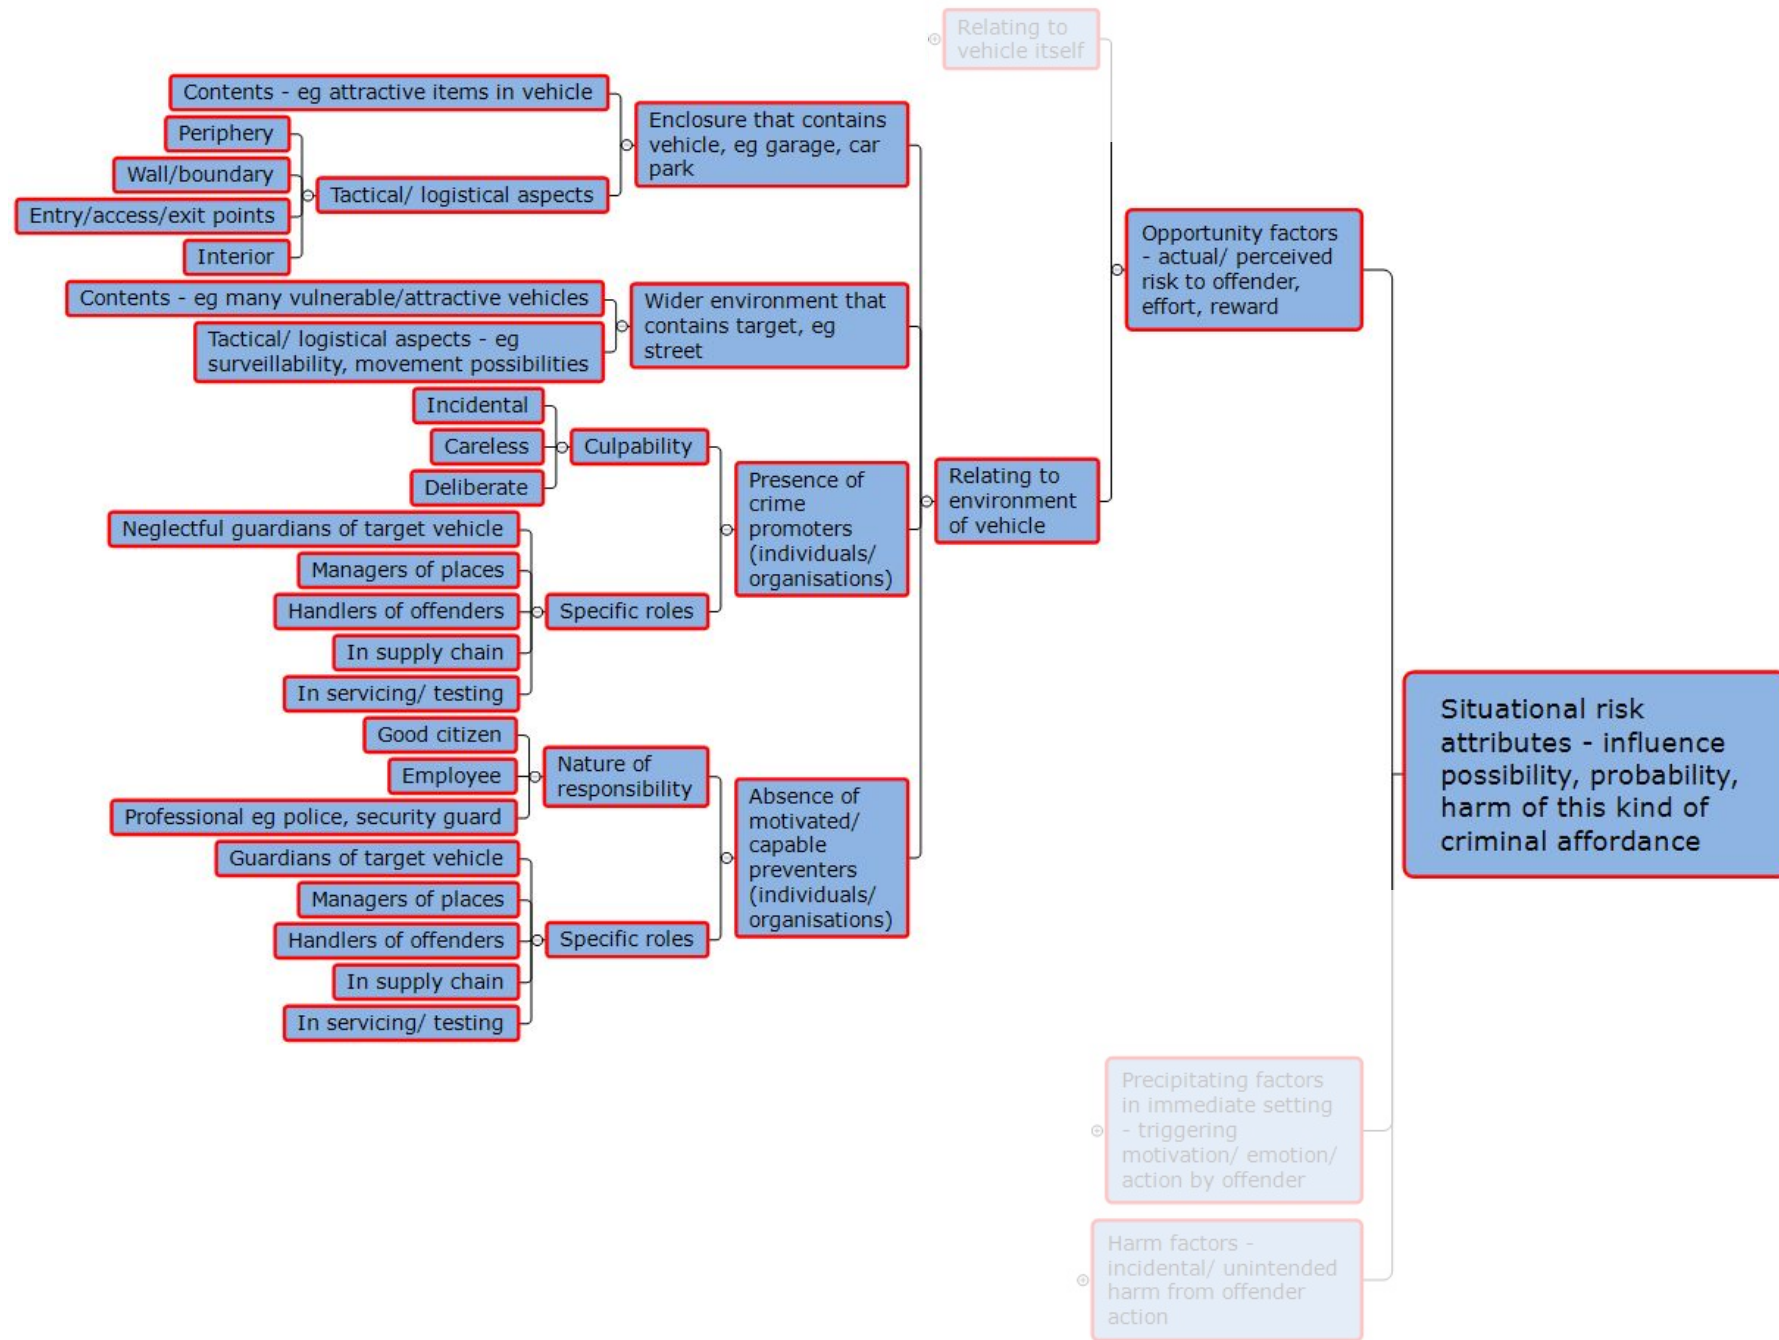

# Crime situation – whole vehicle as target – of misappropriation (theft): situational risk attributes – opportunity factors – relating to vehicle itself

- Using CCO, CRAVED

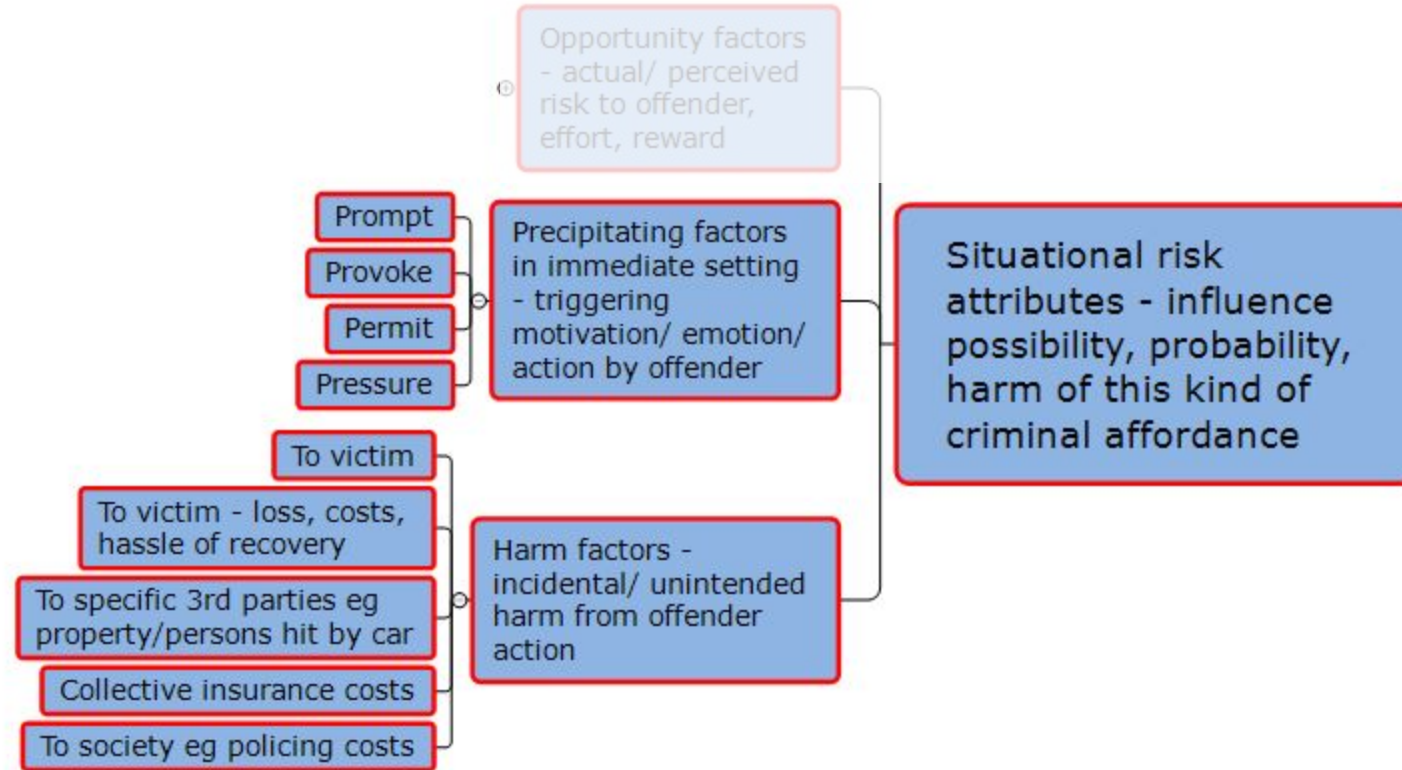

Crime situation – whole vehicle as target – of misappropriation (theft): situational risk attributes – opportunity factors – relating to environment of vehicle

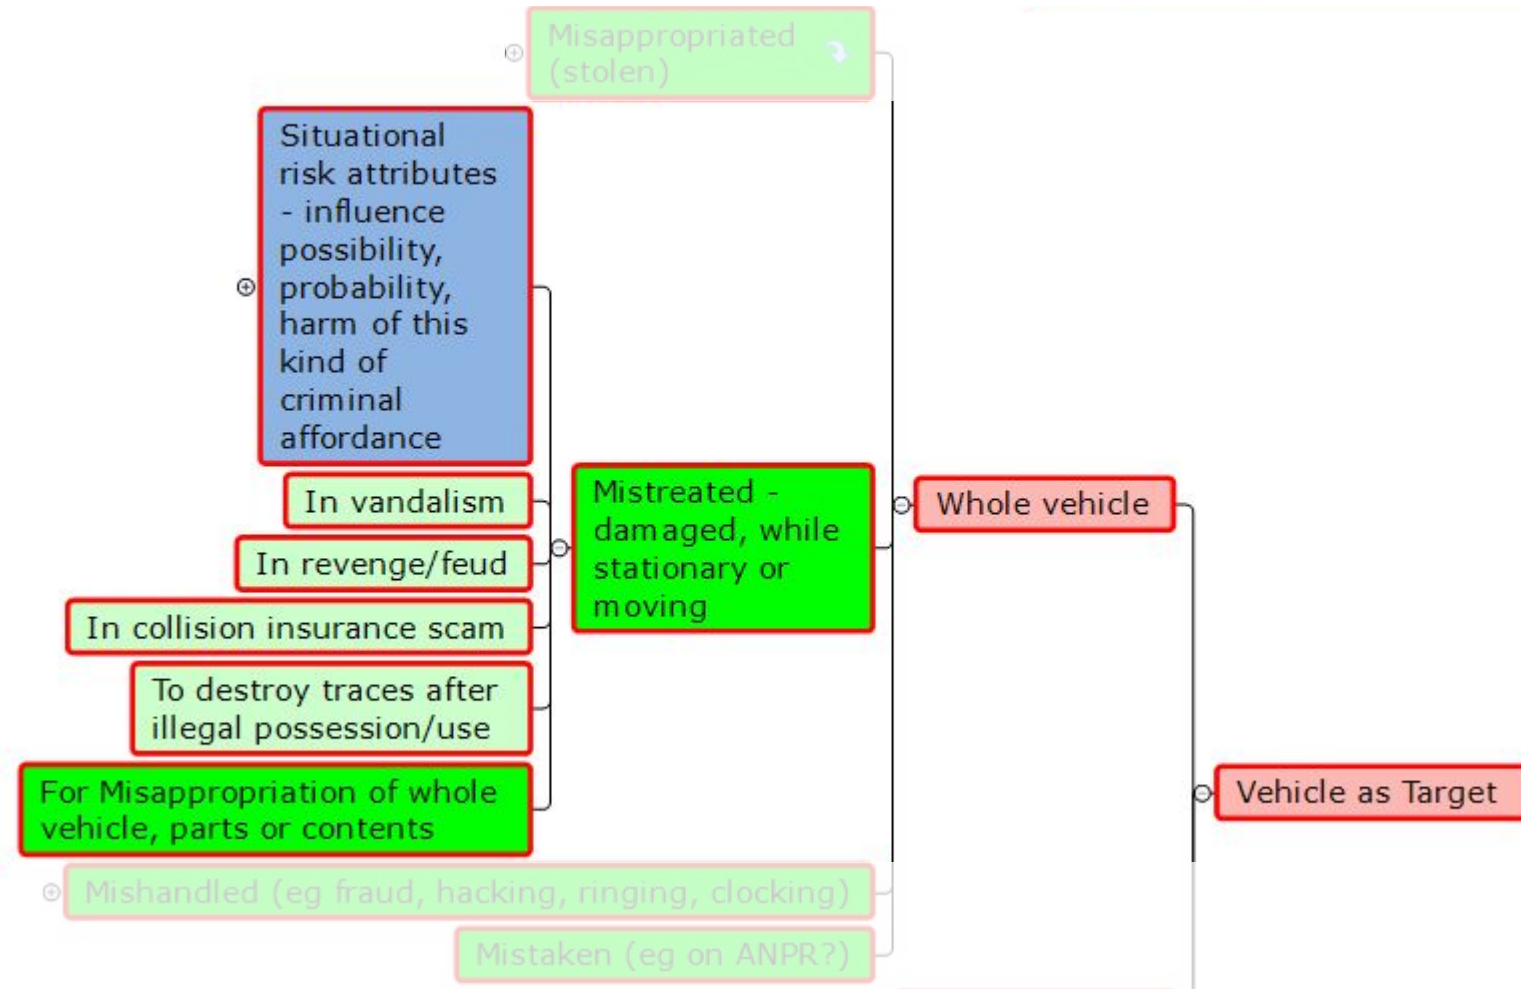

- Using CCO (covering RA, Problem Analysis Triangle, Geometry of crime)

# Crime situation – whole vehicle as target – of misappropriation (theft): situational risk attributes – precipitating factors in immediate setting, and harm factors

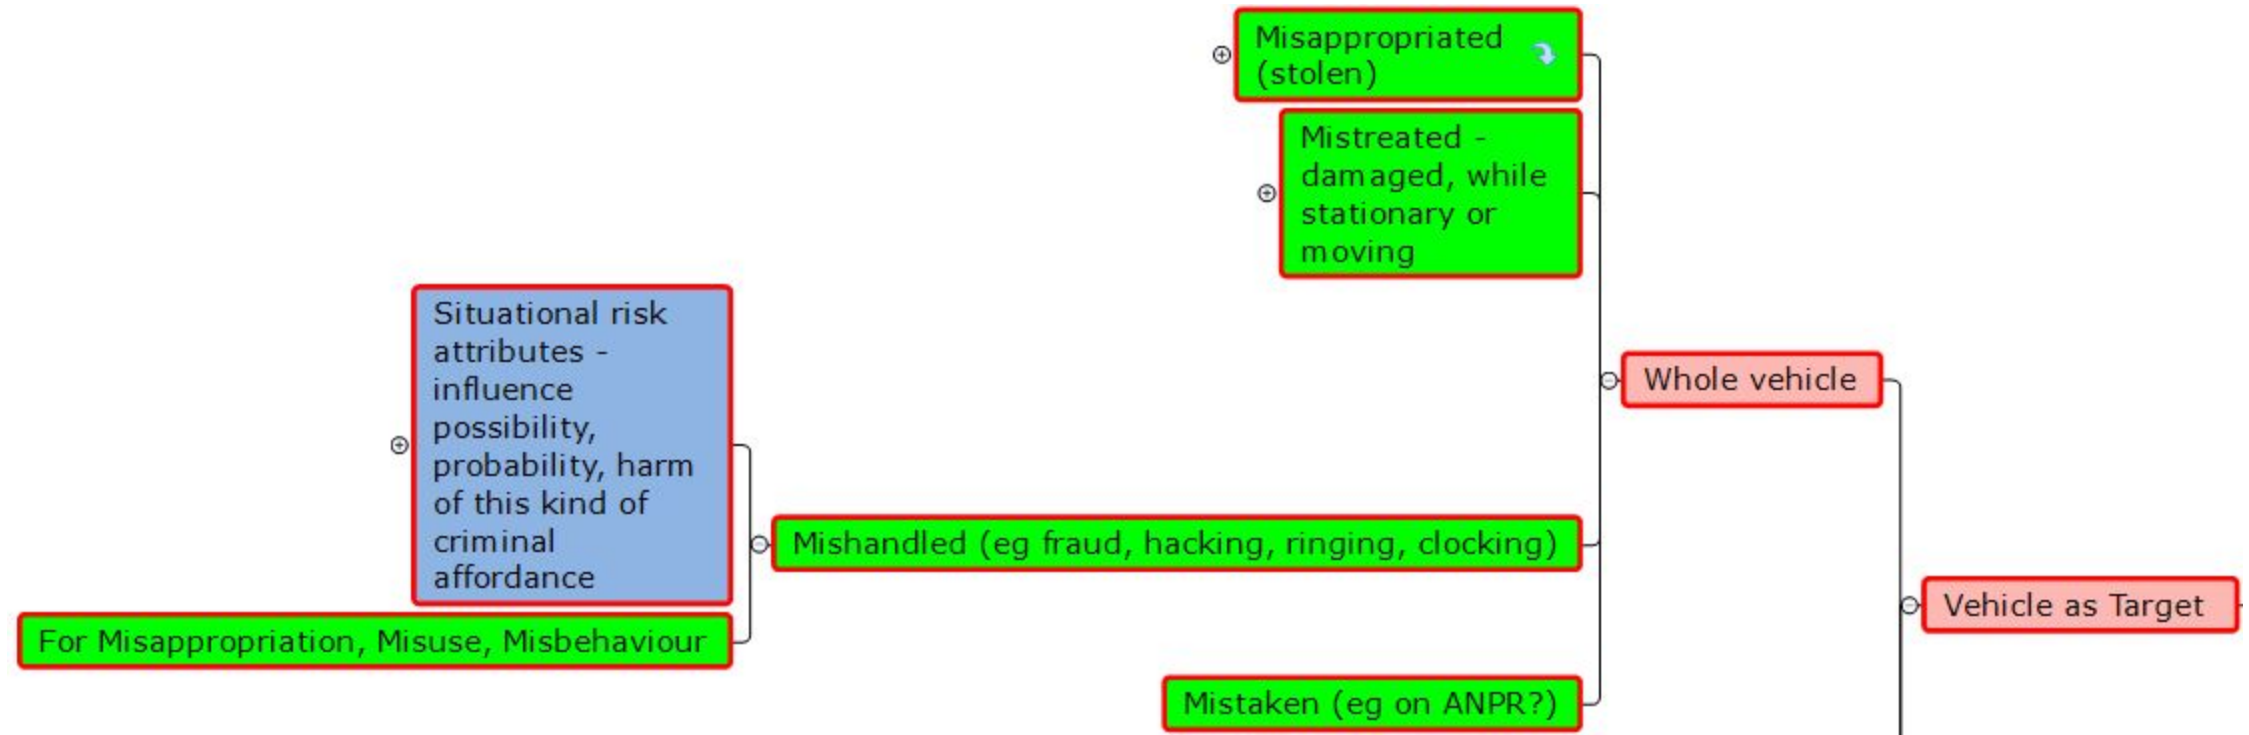

- Using Crime Precipitators

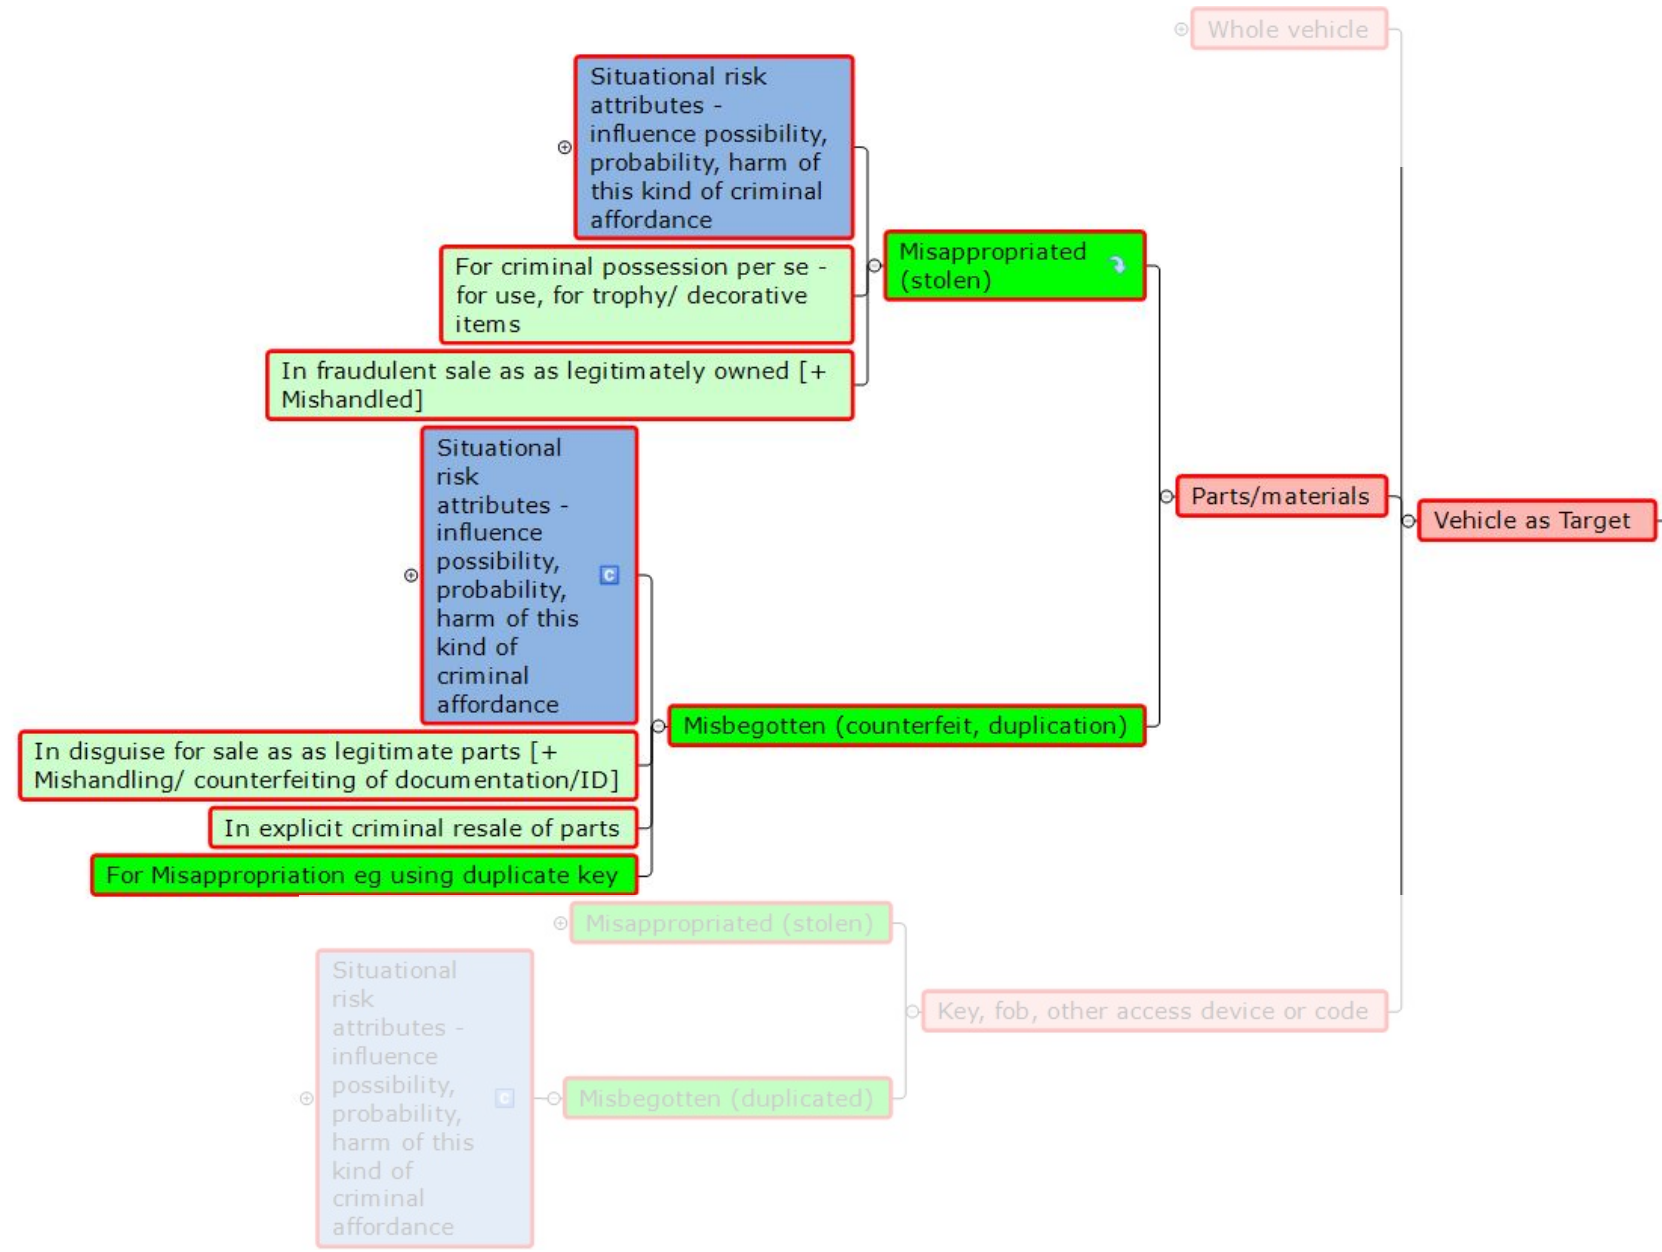

# Crime situation – whole vehicle as target – of mistreatment: detailed affordances, and linked generic affordances

# Crime situation – whole vehicle as target – of mishandling/mistake: detailed affordances, and linked generic affordances

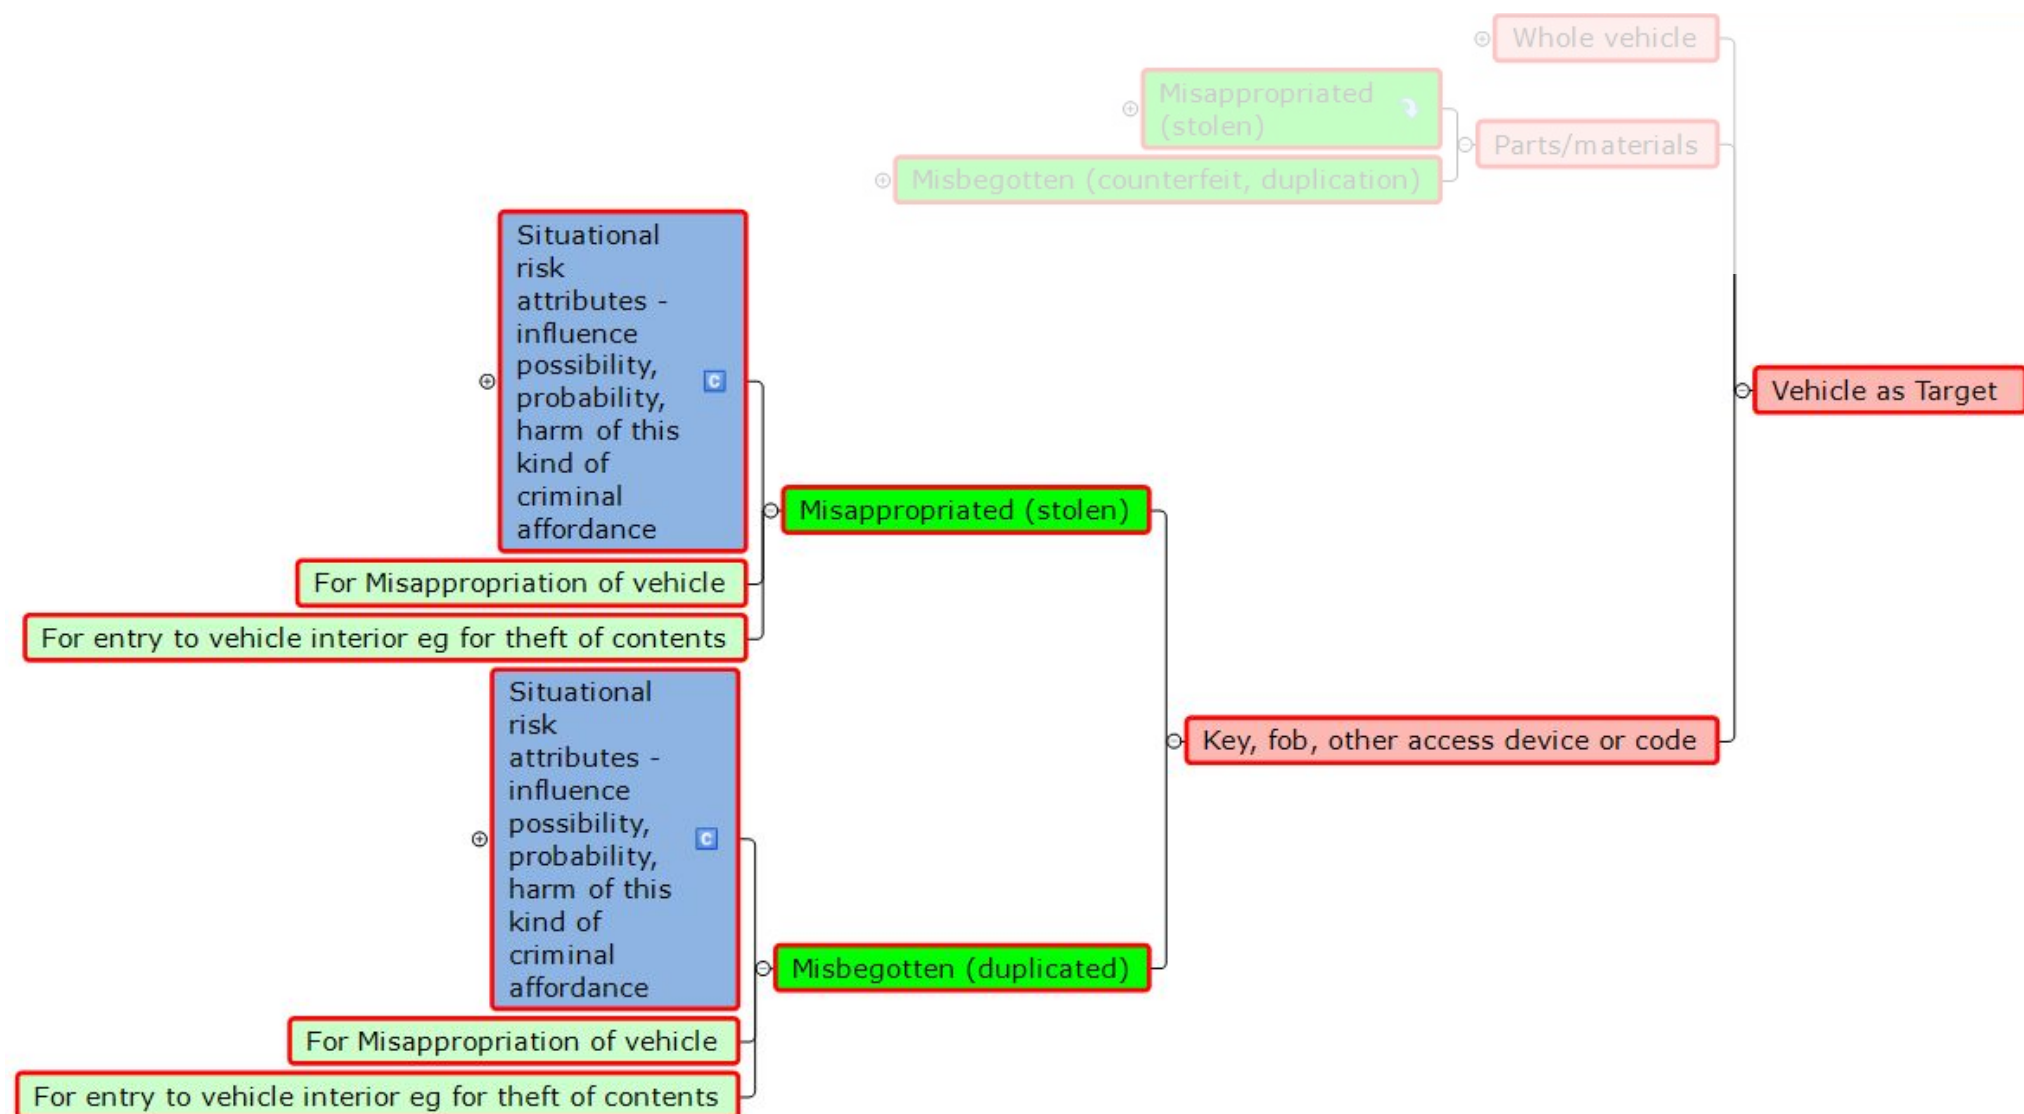

# Crime situation – parts/materials of vehicle as target – of misappropriation/misbegetting (counterfeit etc): generic and detailed affordances, and linked generic affordances

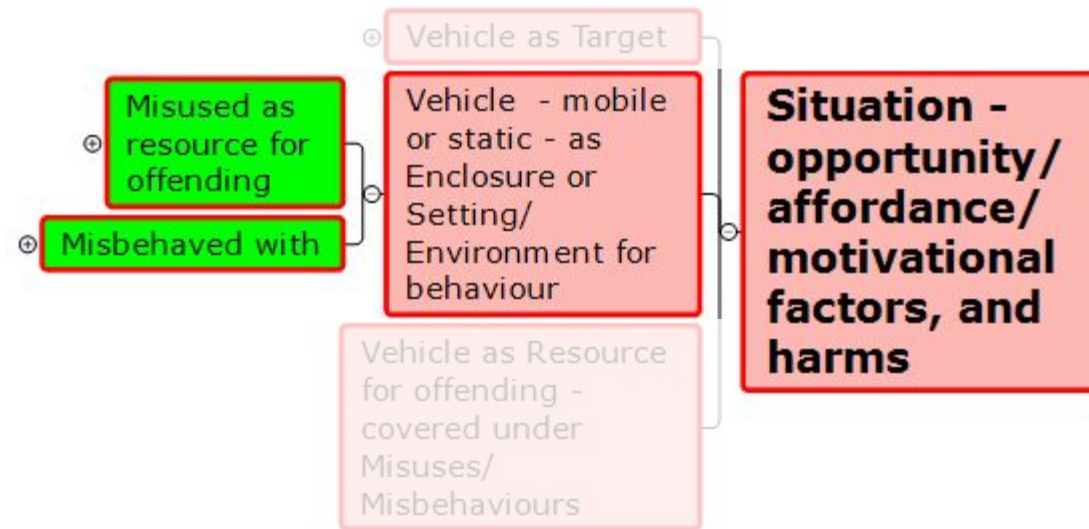

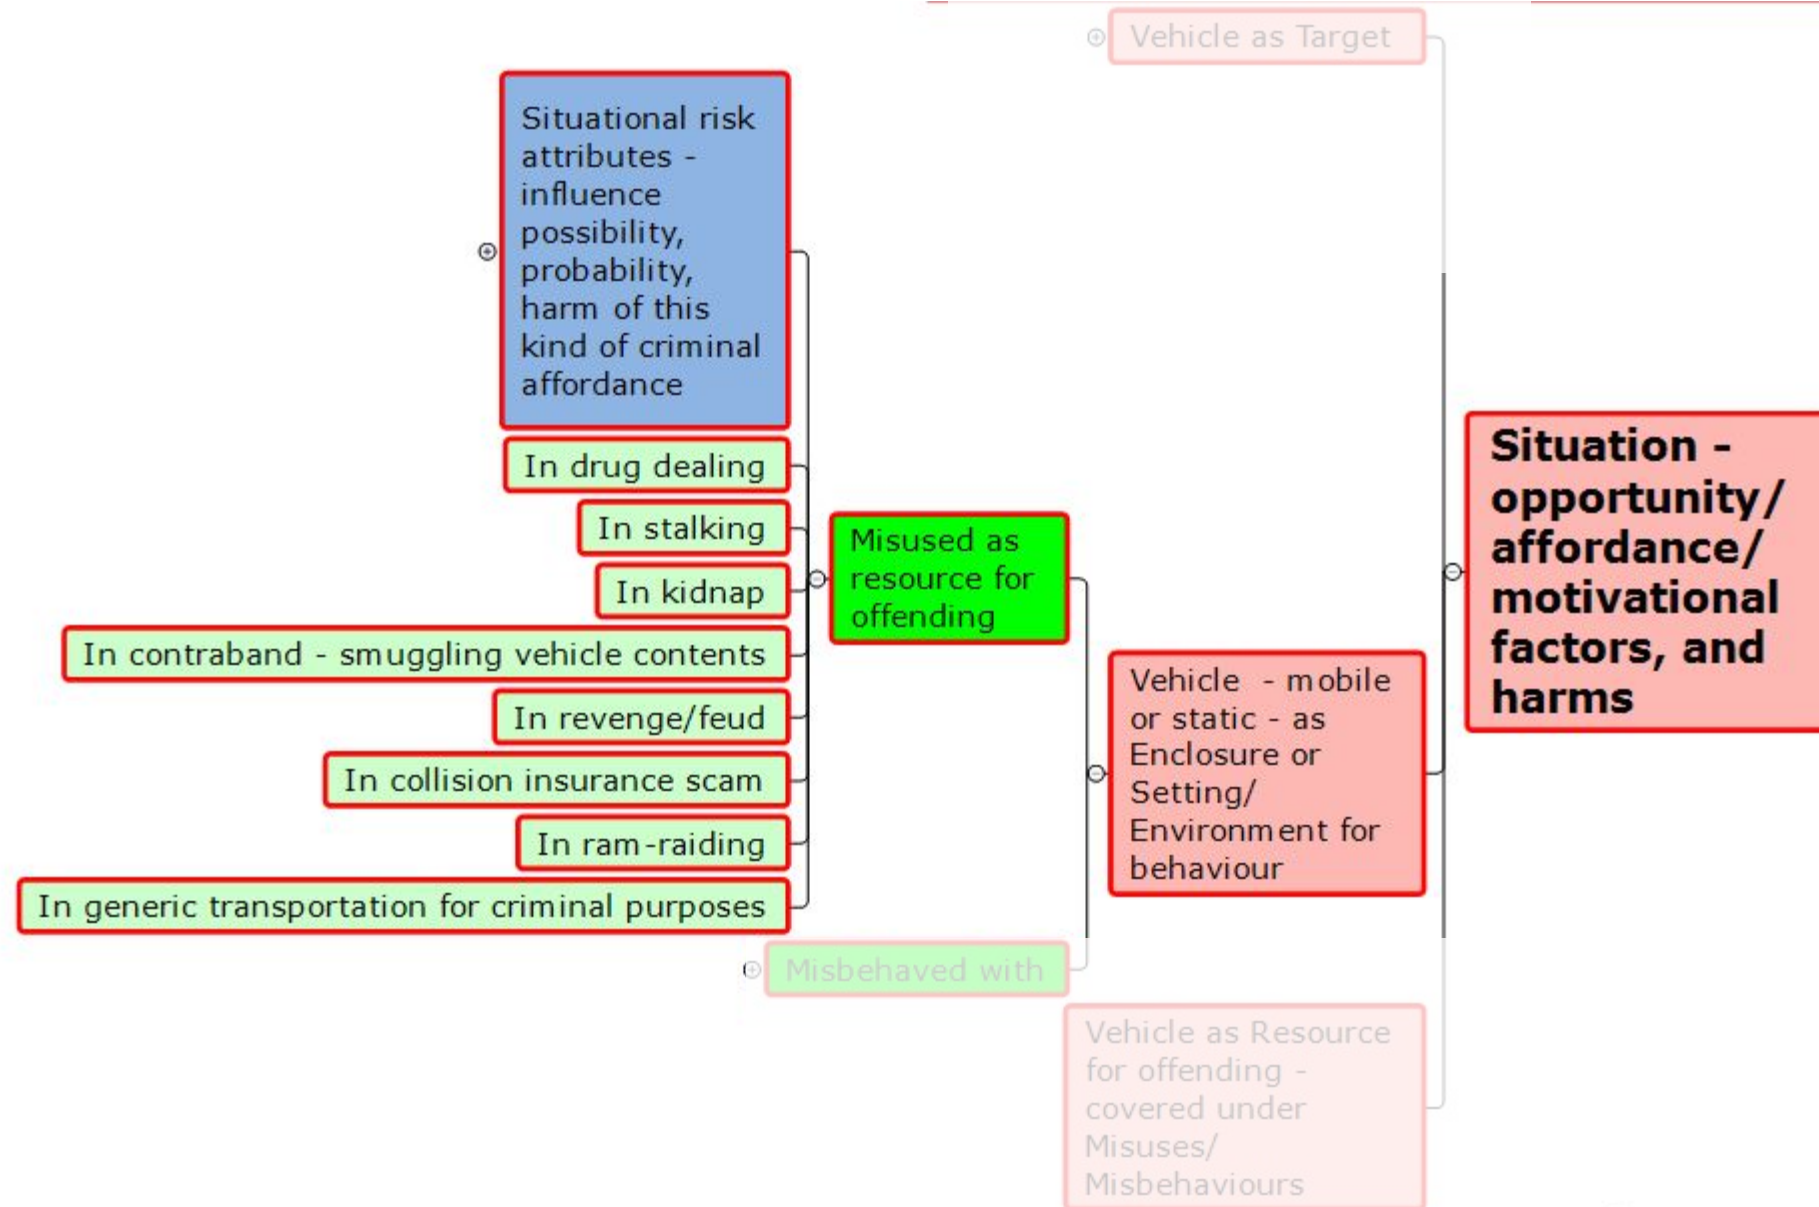

Crime situation – key, fob, other access device or code of vehicle as target – of misappropriation/misbegetting (duplication etc): generic and specific affordances

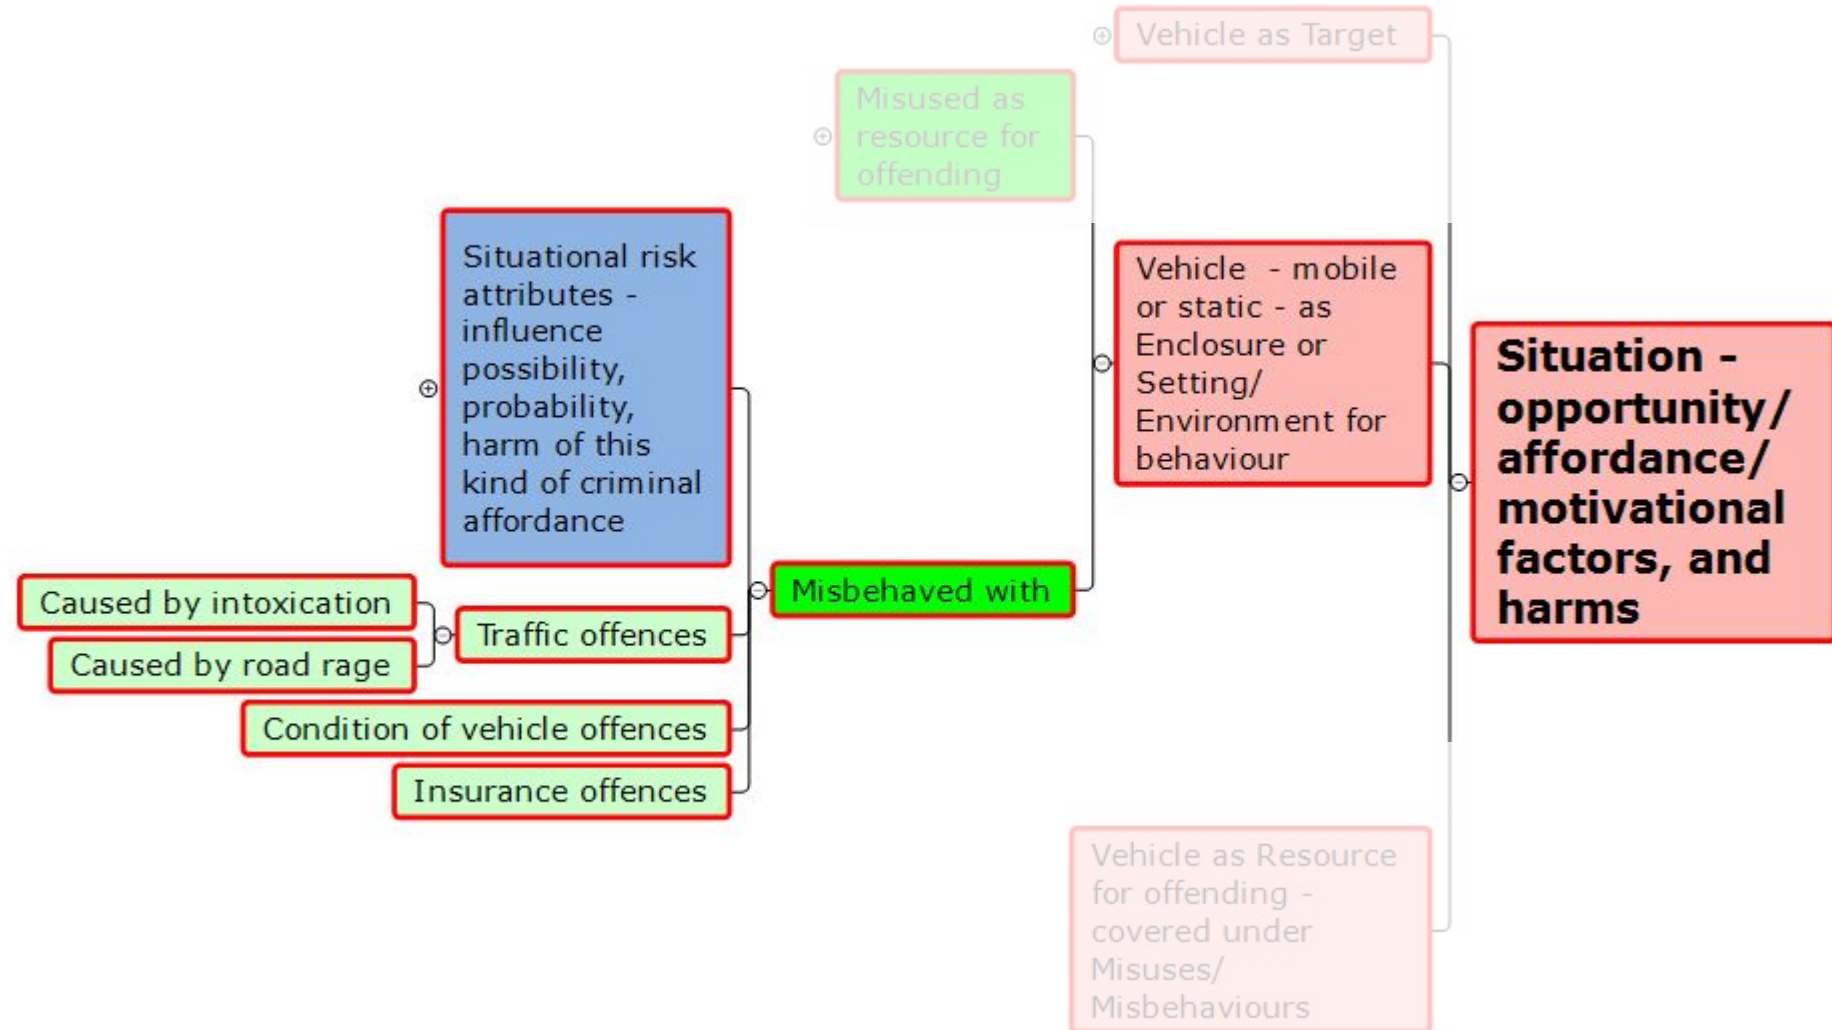

# Crime situation – vehicle as enclosure or setting: for misuse and misbehaviour

Crime situation – vehicle as enclosure or setting: for misuse and its detailed affordances

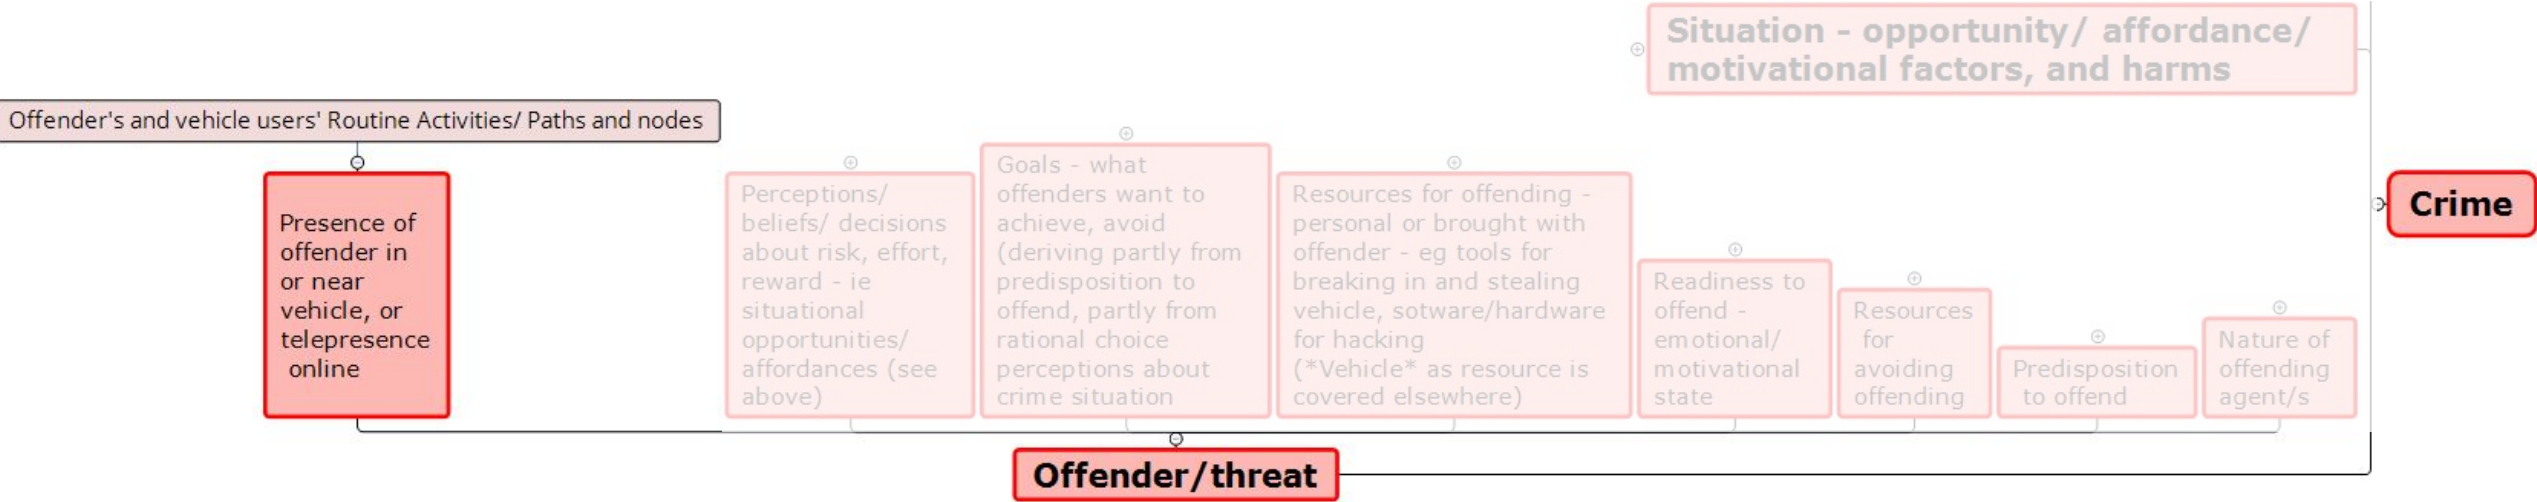

# Crime situation – vehicle as enclosure or setting: for misbehaviour and its detailed affordances

# Offenders and the threat they pose in vehicle crime: presence

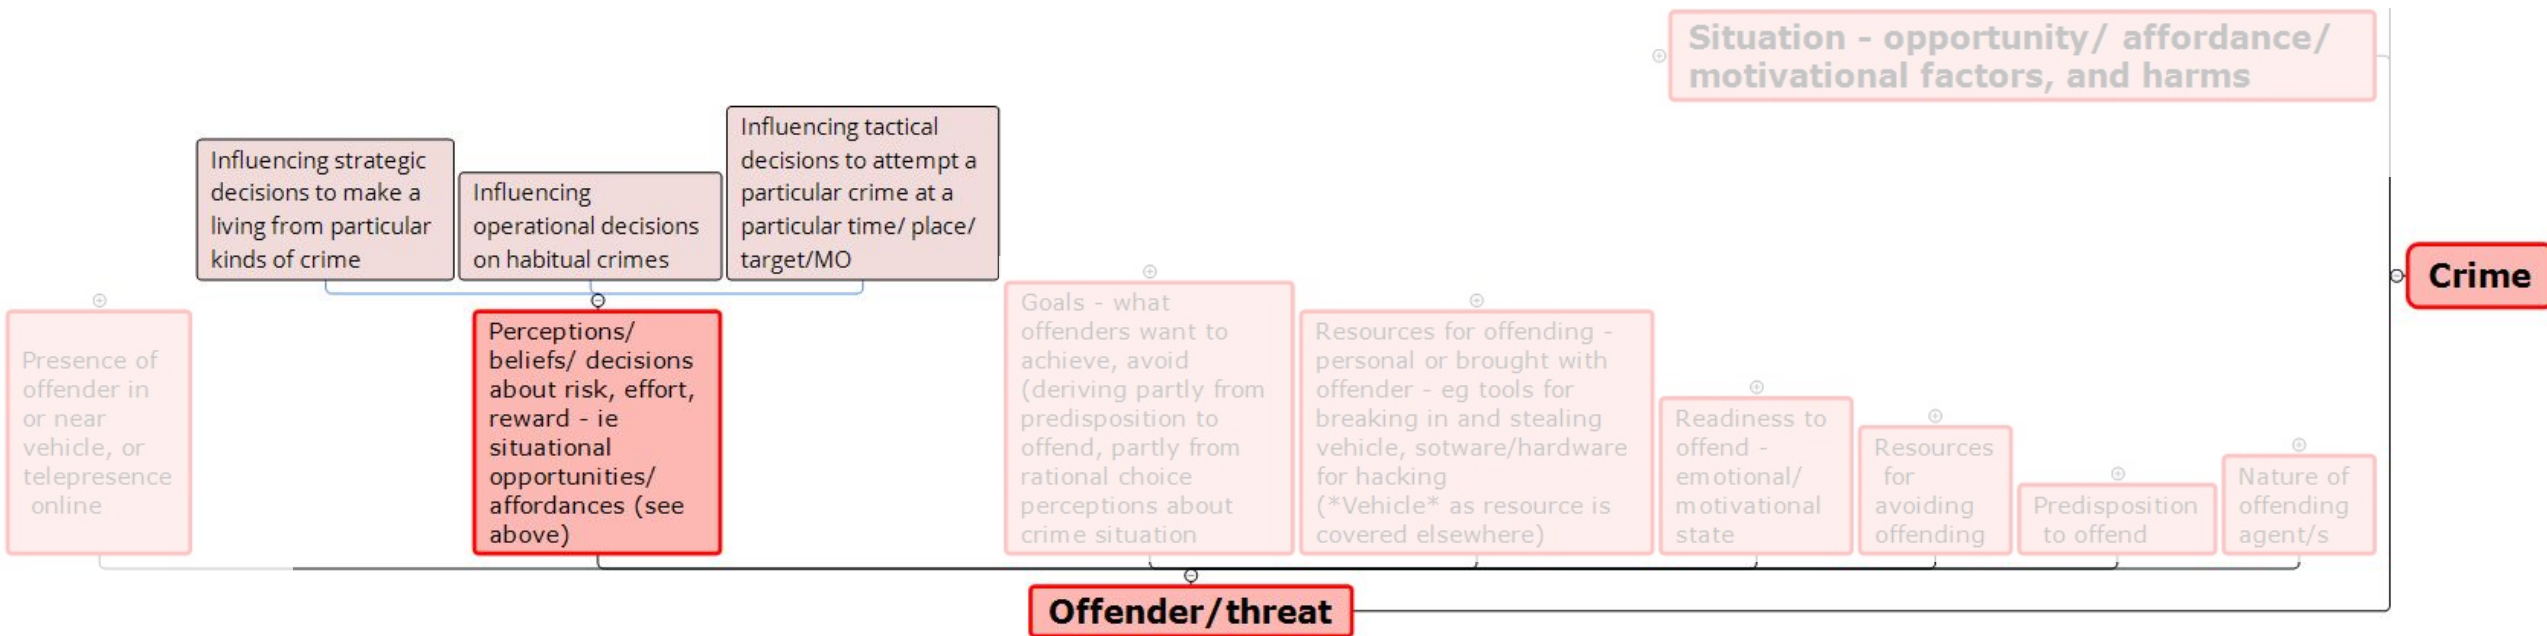

• Modified from CCO (covering RA, Geometry of Crime)

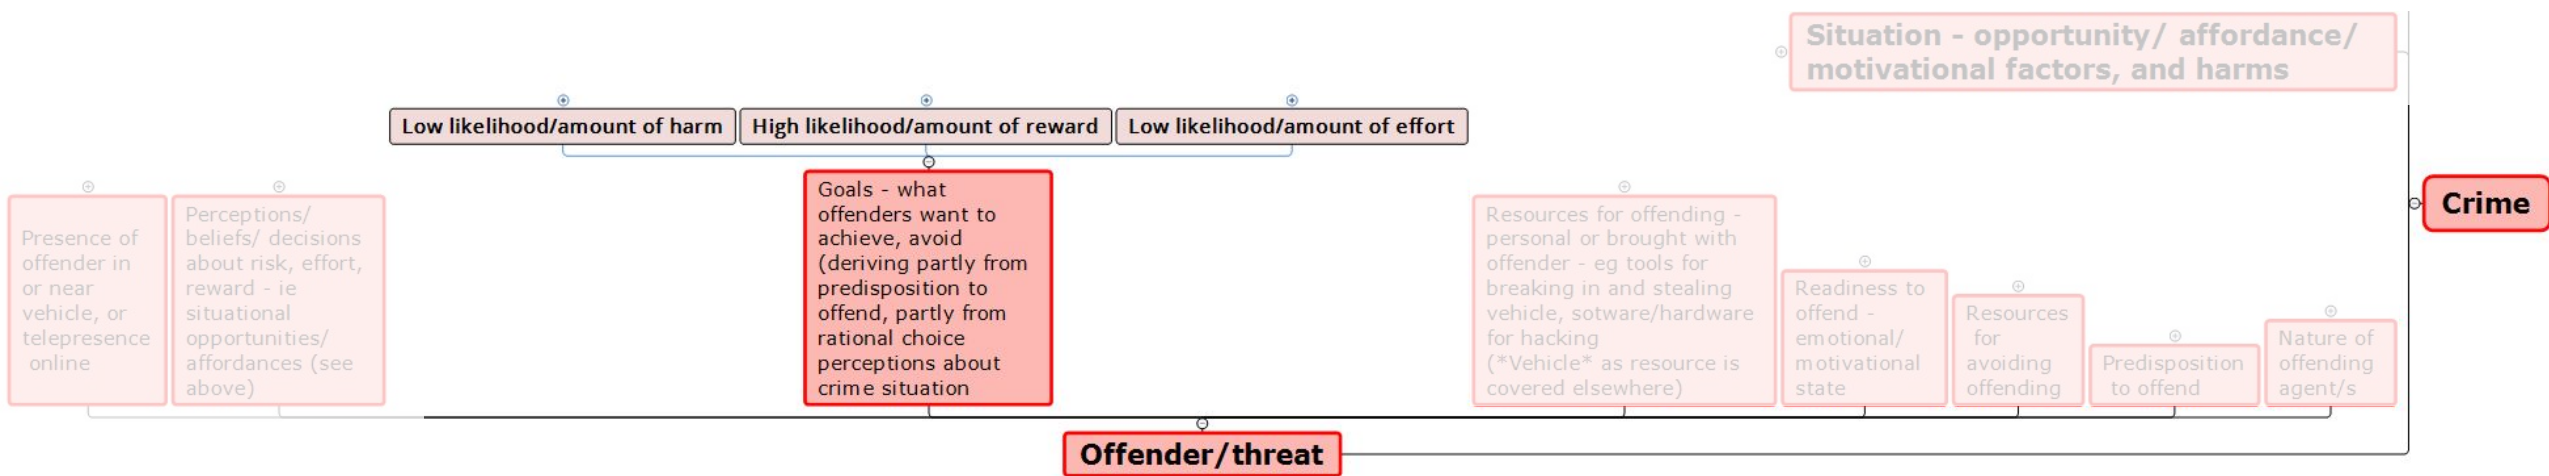

# Offenders and the threat they pose in vehicle crime: perceptions and decisions

- Rational Choice at several levels

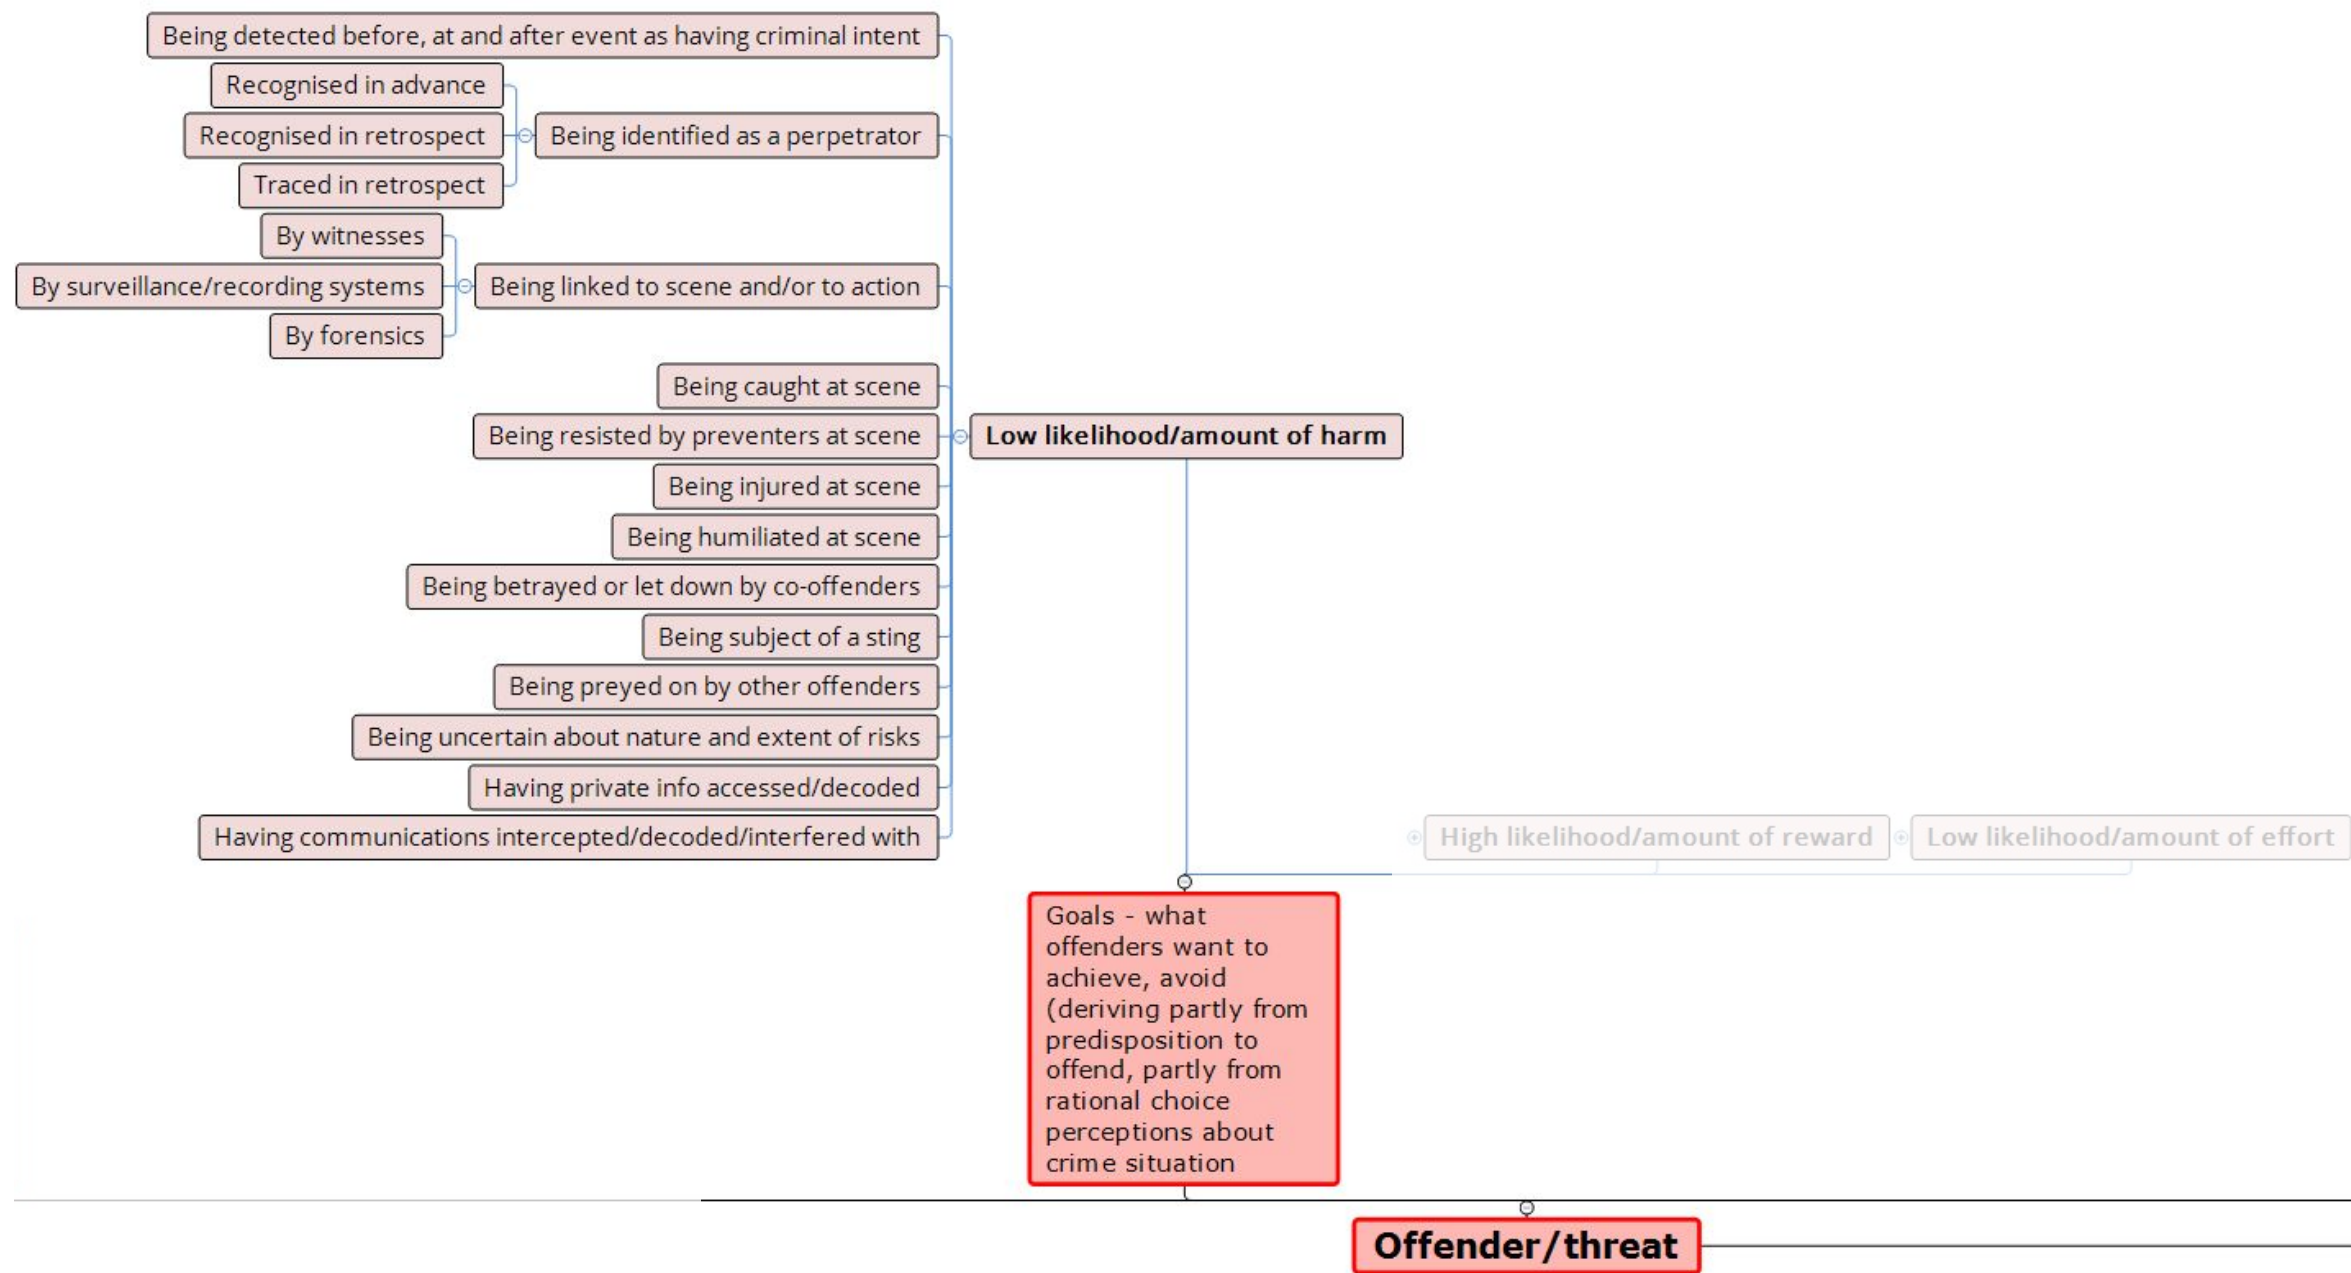

# Offenders and the threat they pose in vehicle crime: goals/ purposes

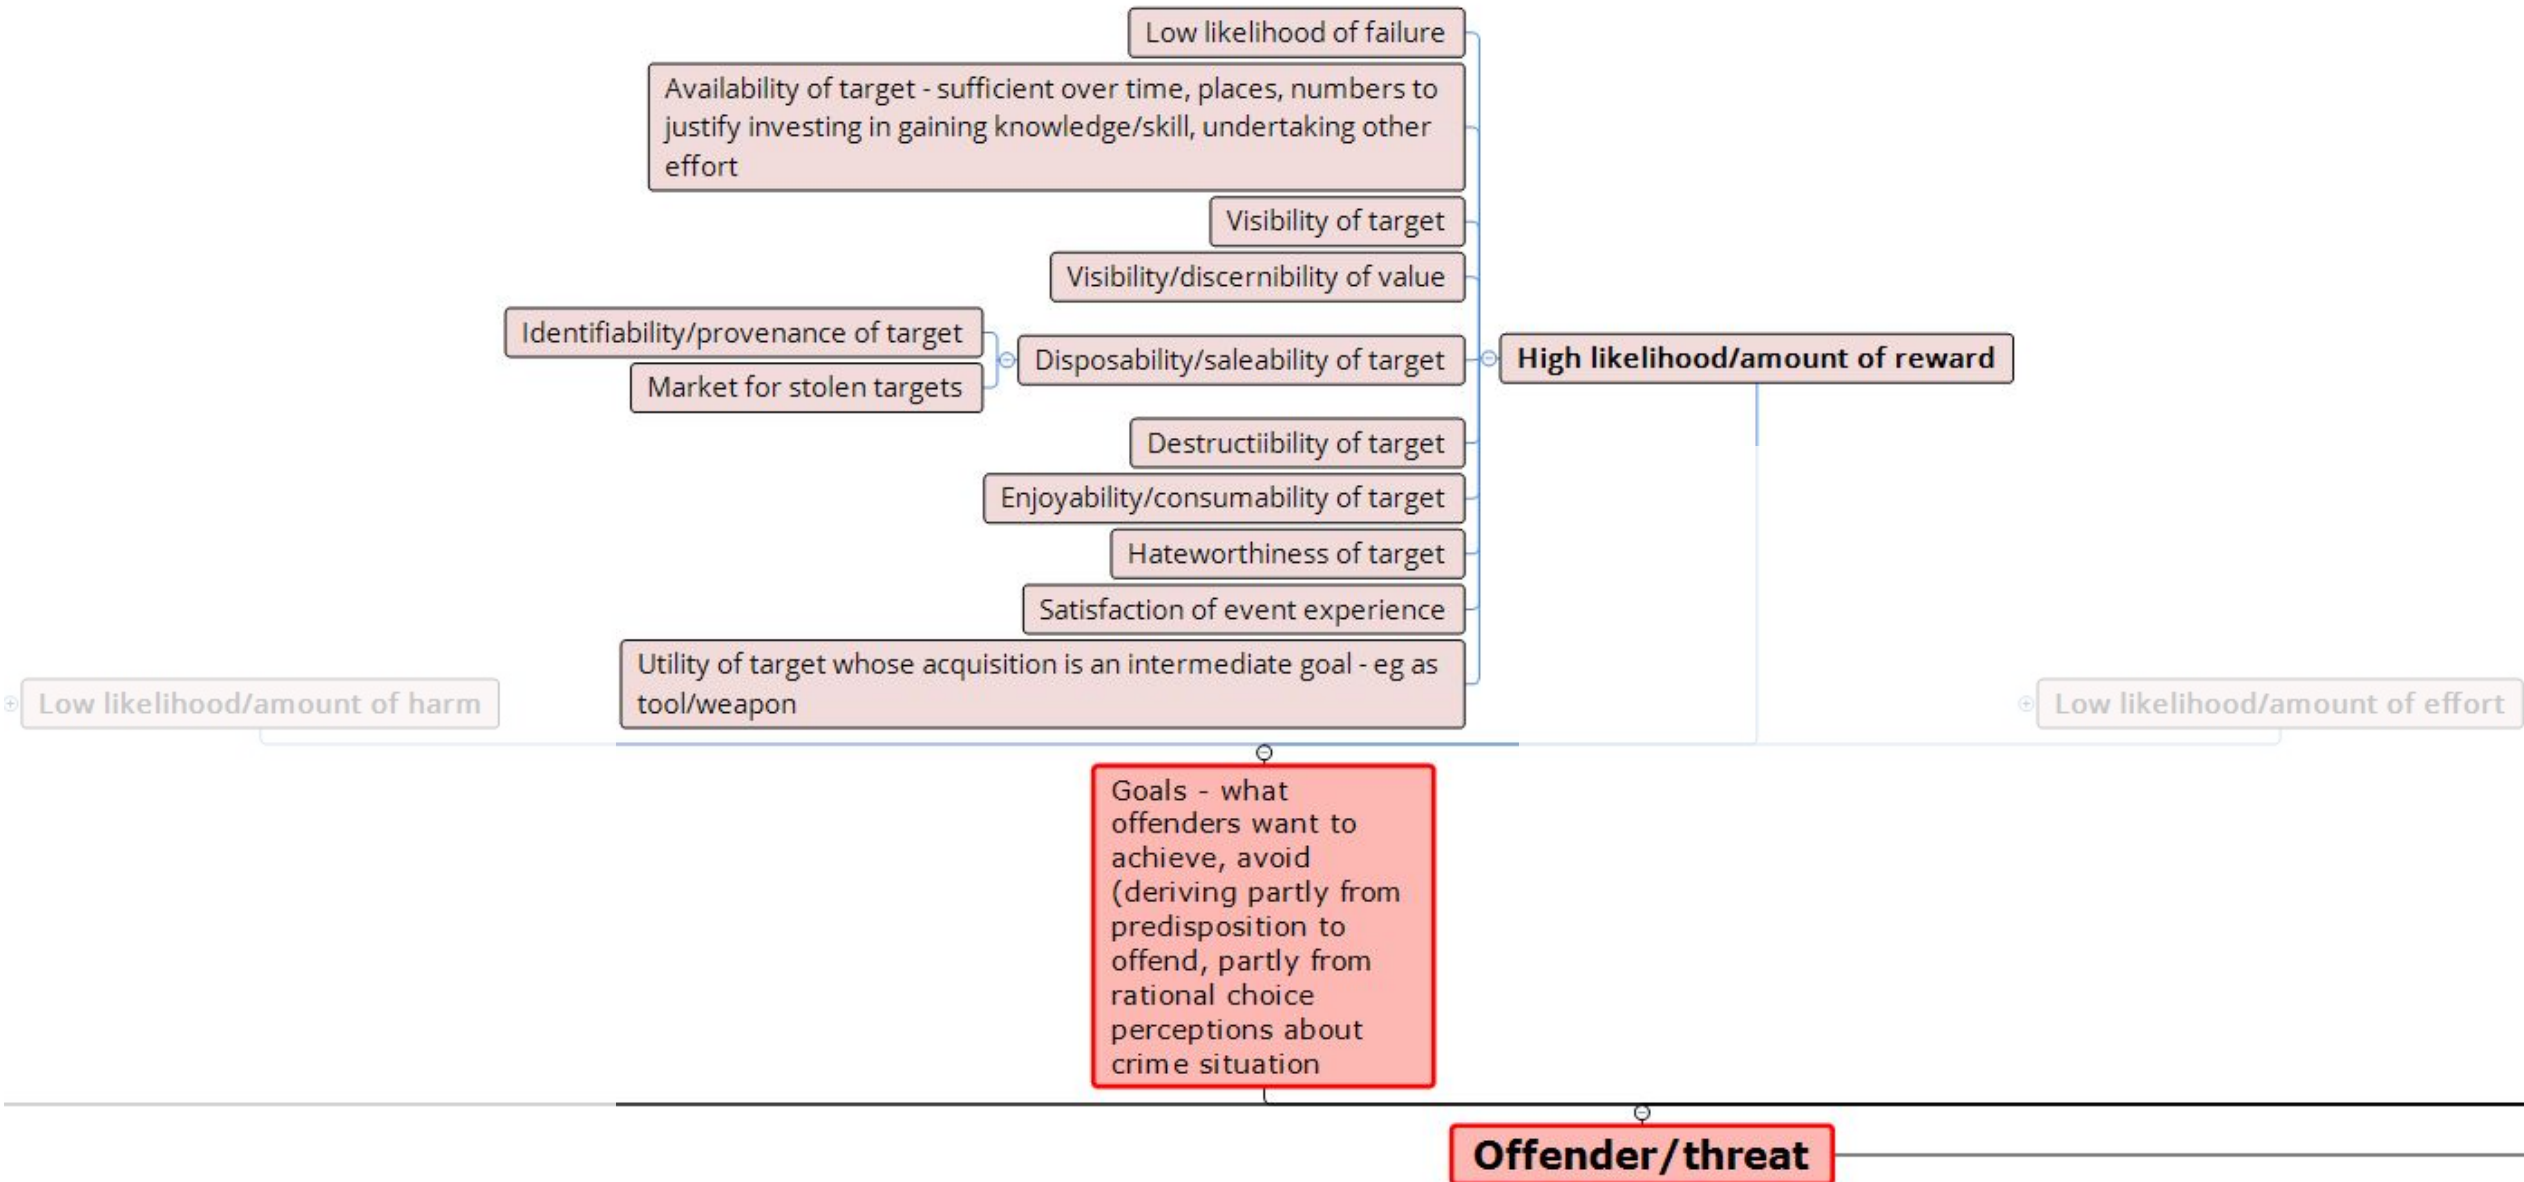

- Rational Choice

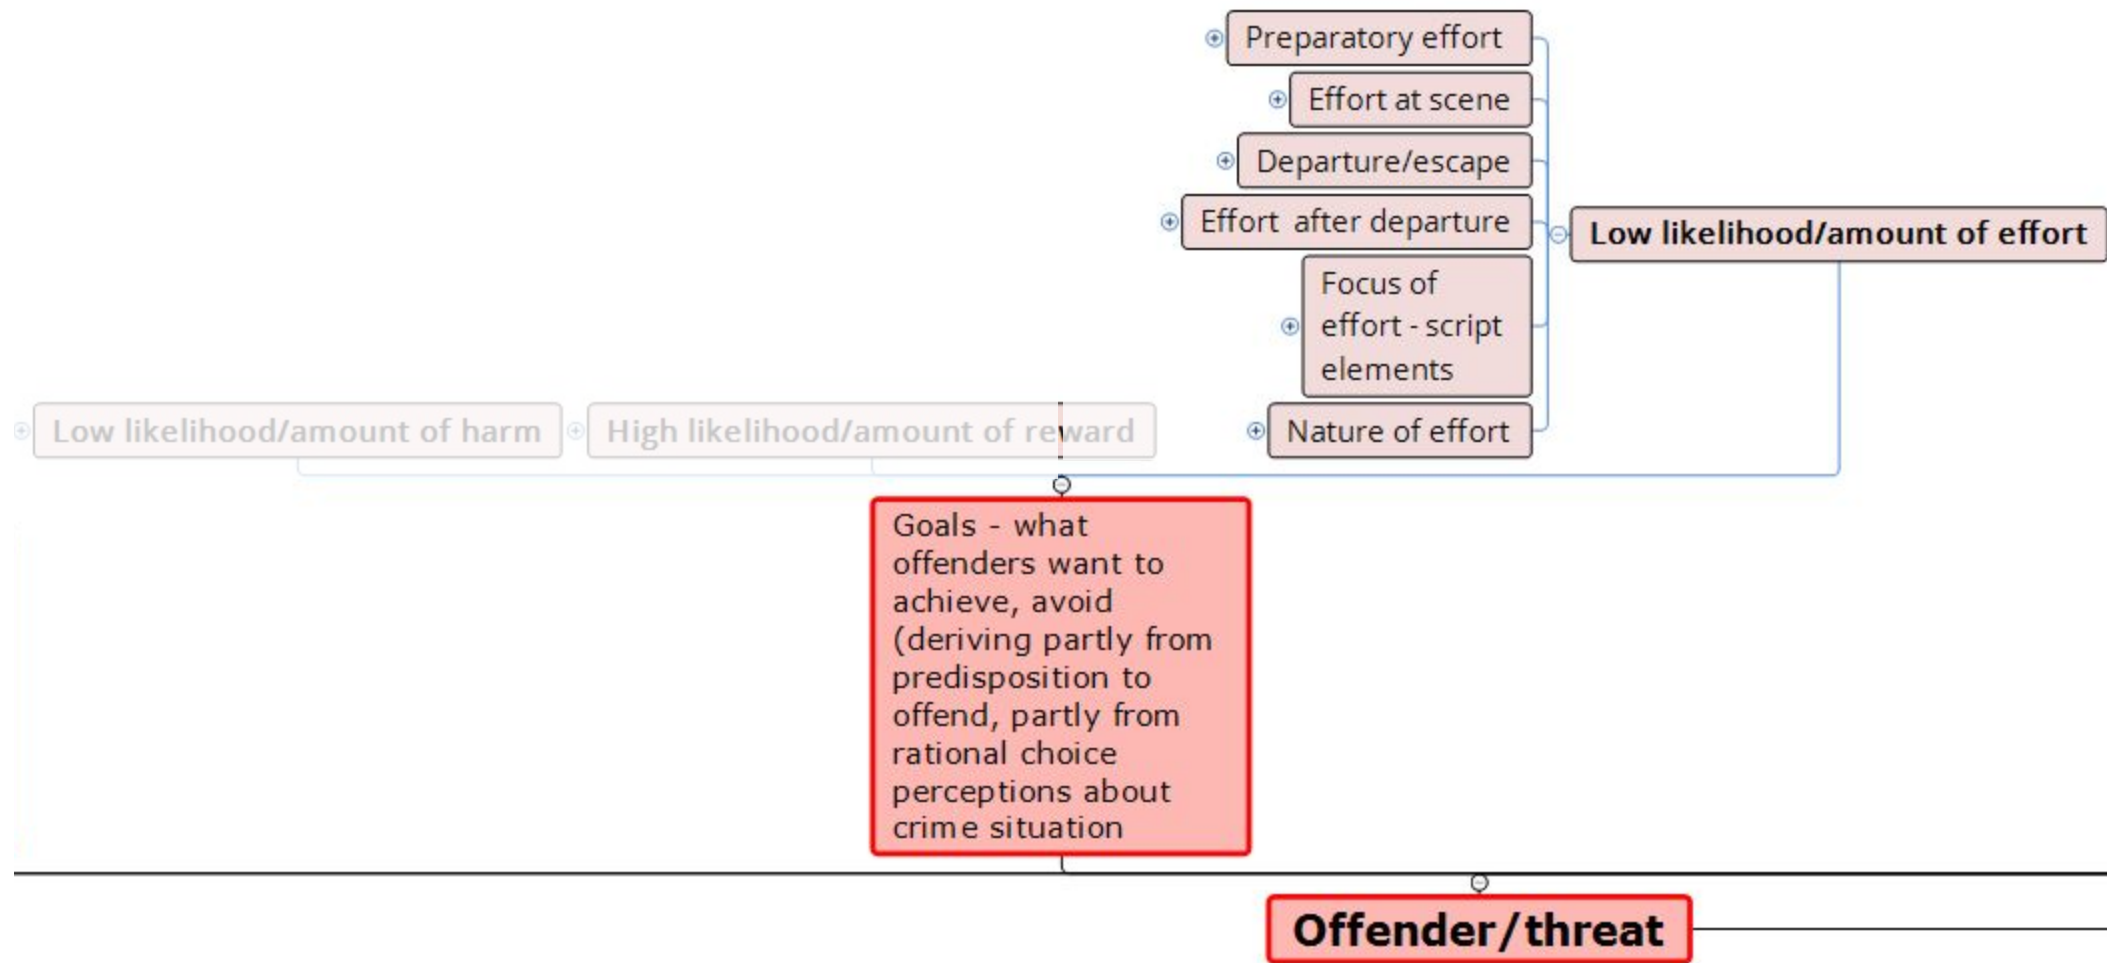

# Offenders and the threat they pose in vehicle crime: goals/ purposes – low harm

# Offenders and the threat they pose in vehicle crime: goals/ purposes – high reward

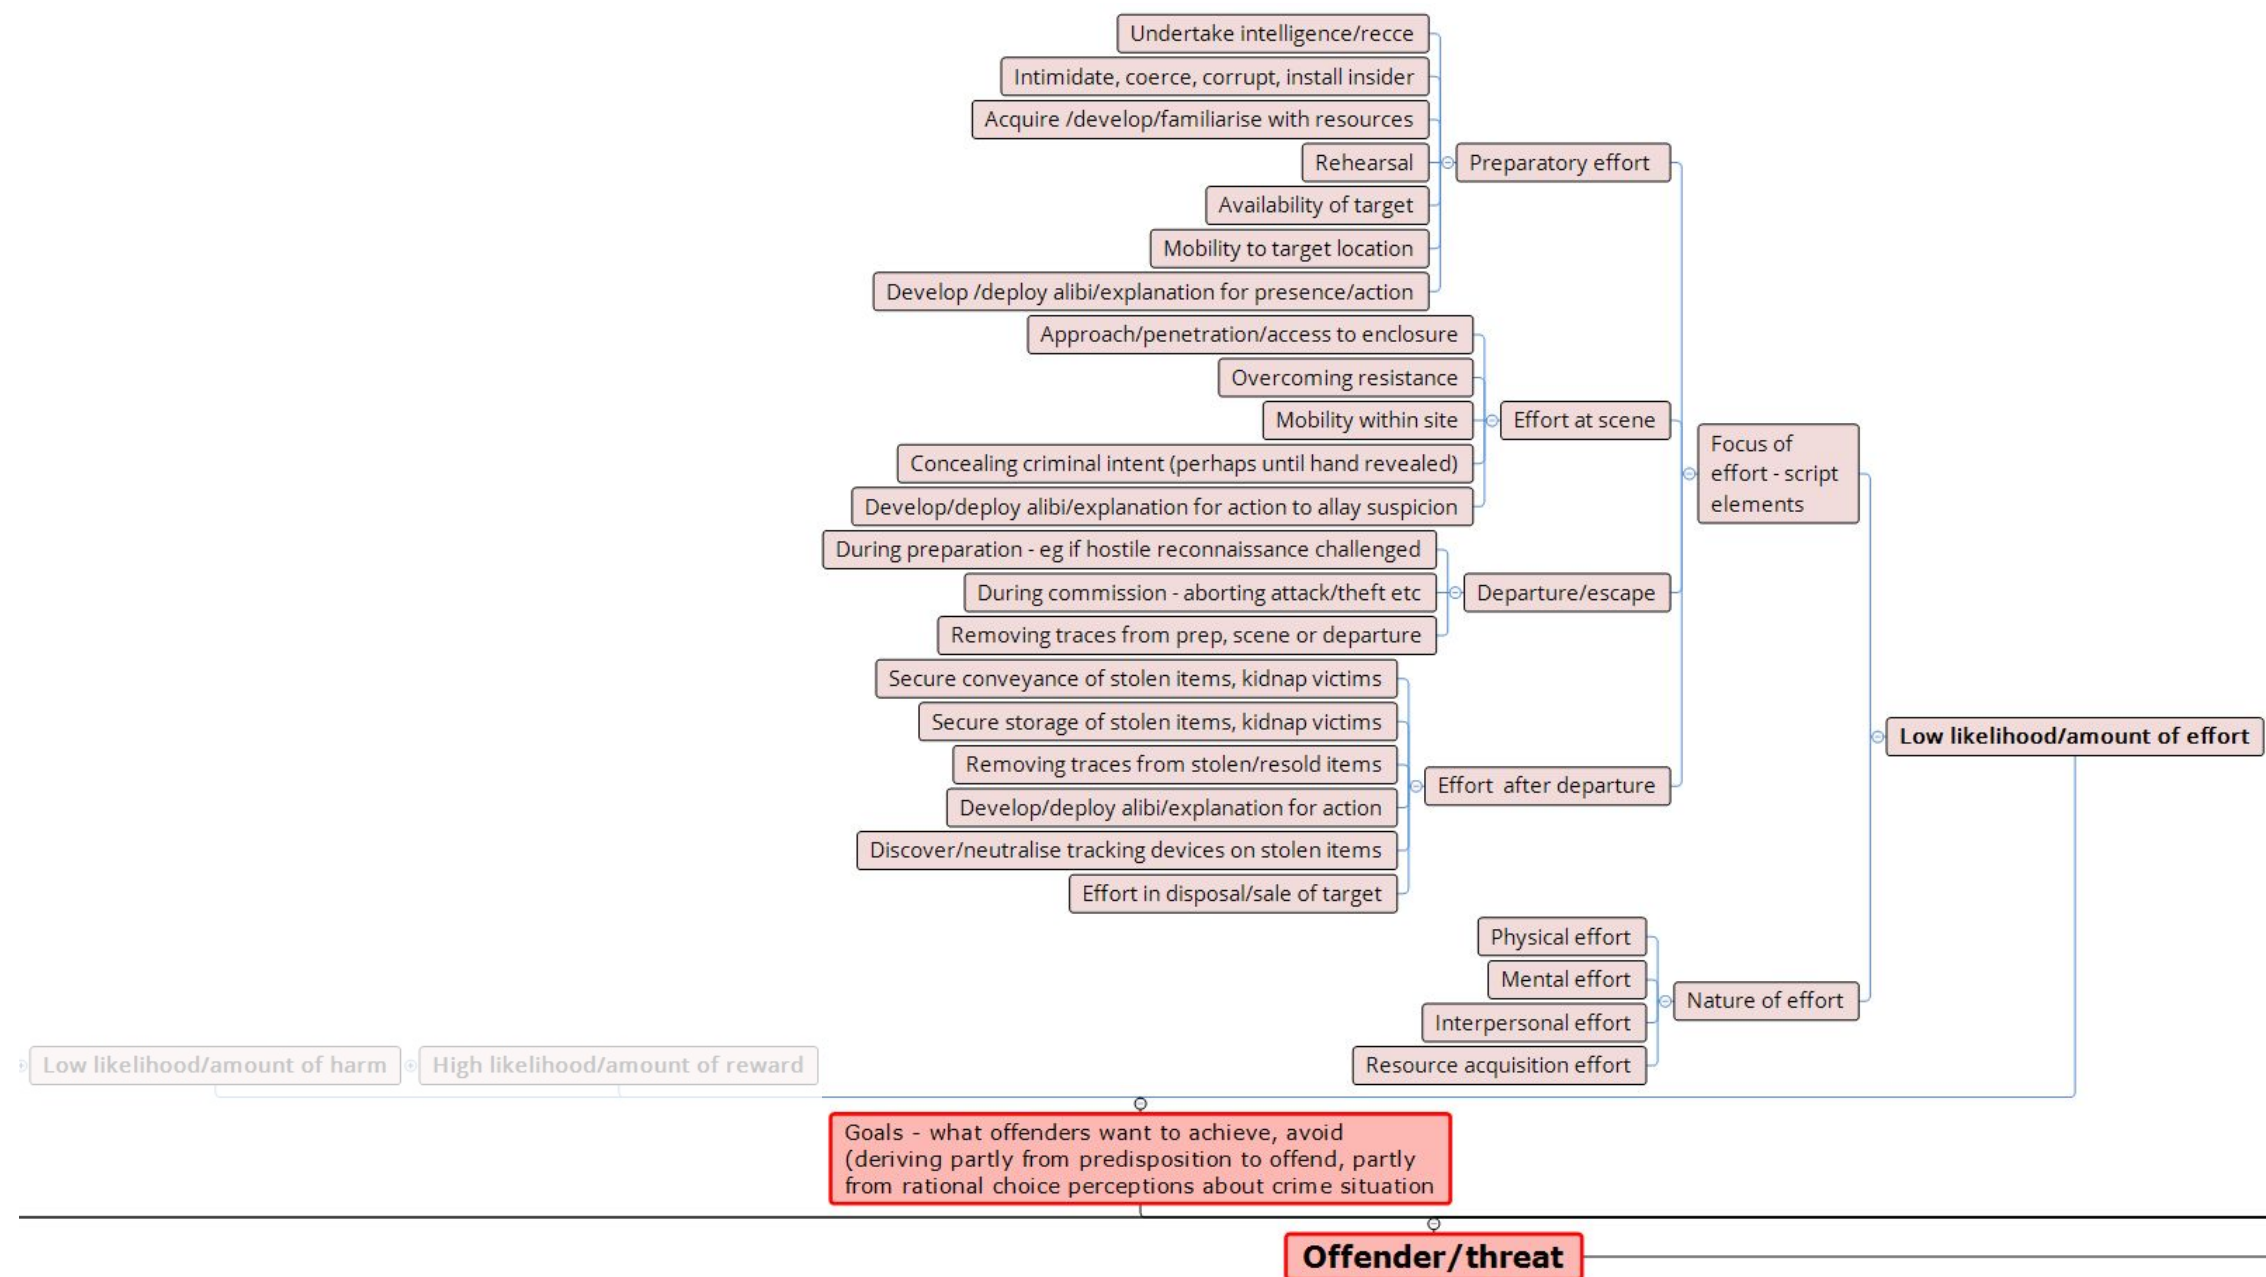

# Offenders and the threat they pose in vehicle crime: goals/ purposes – low effort

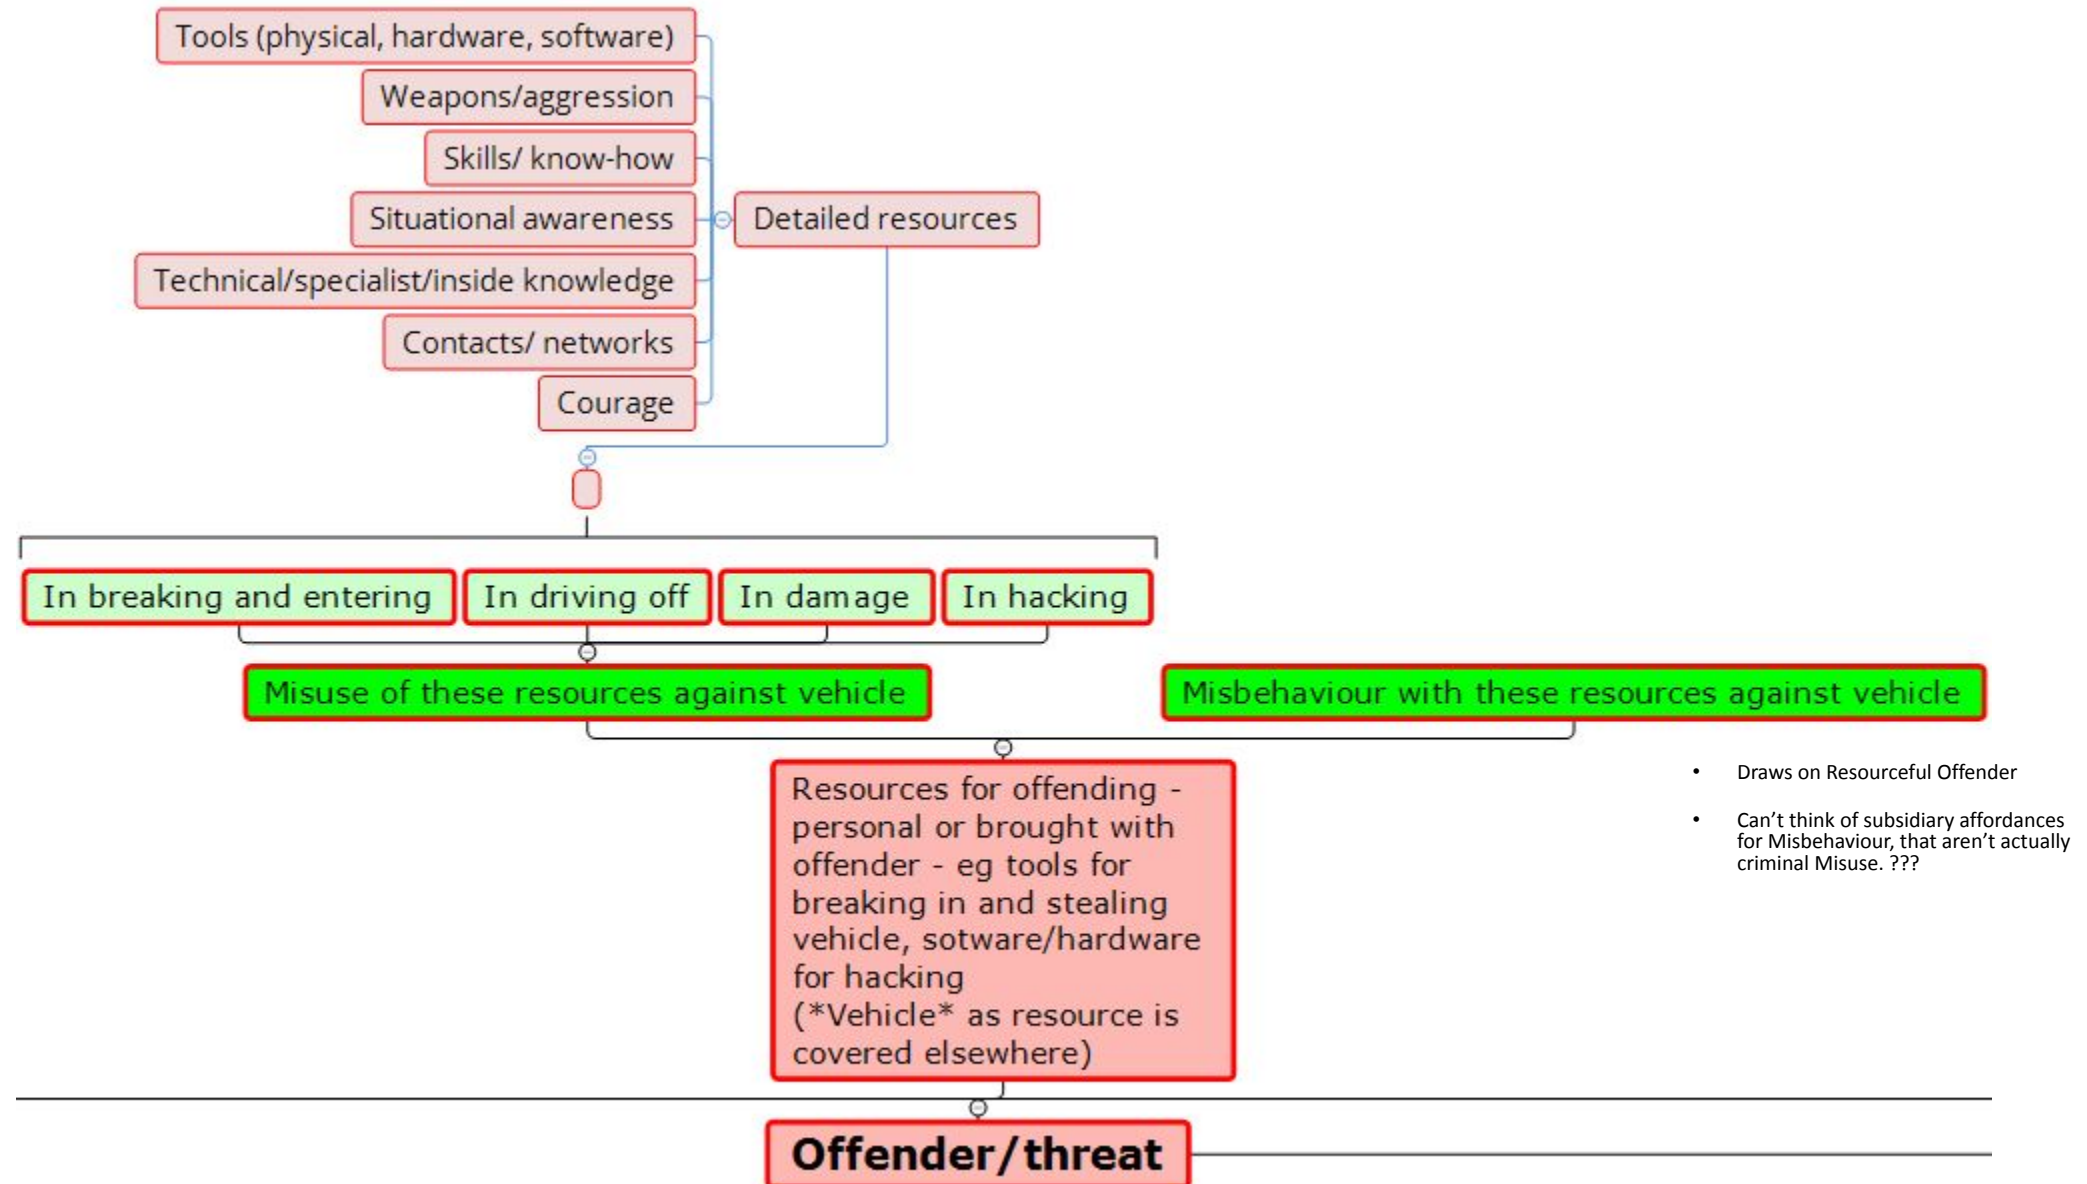

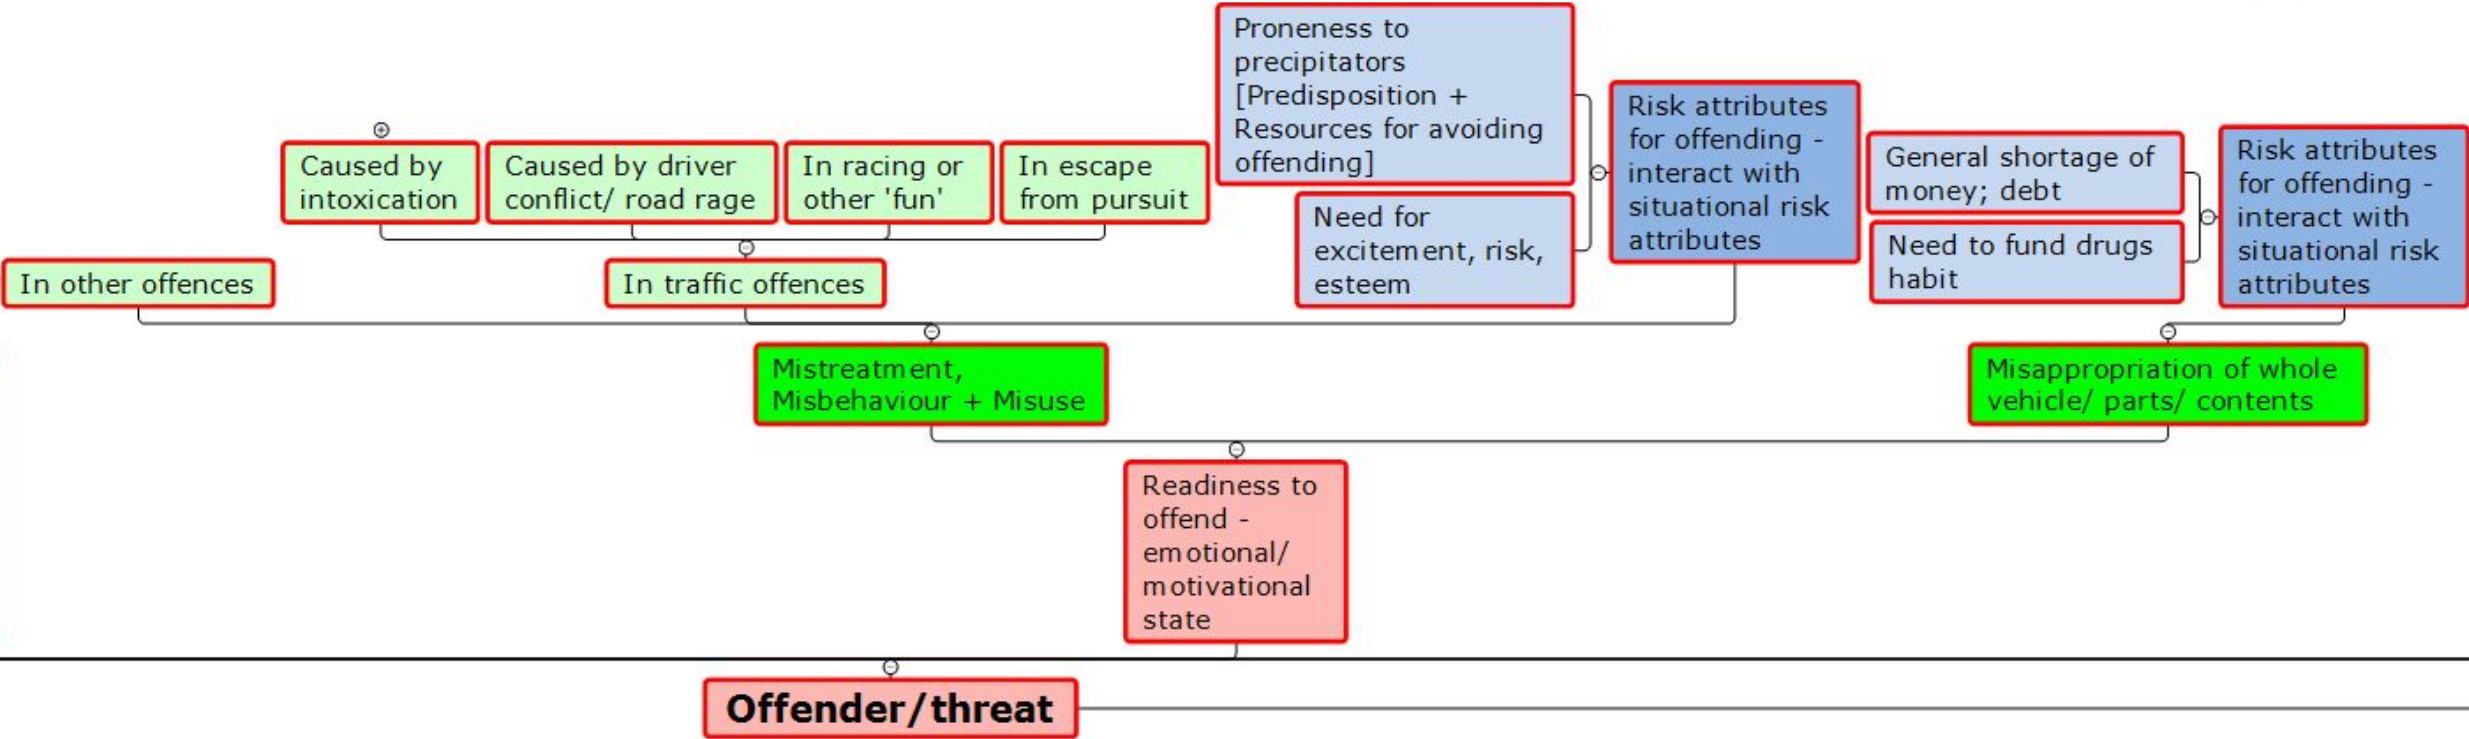

# Offenders and the threat they pose in vehicle crime: goals/ purposes – low effort - detail

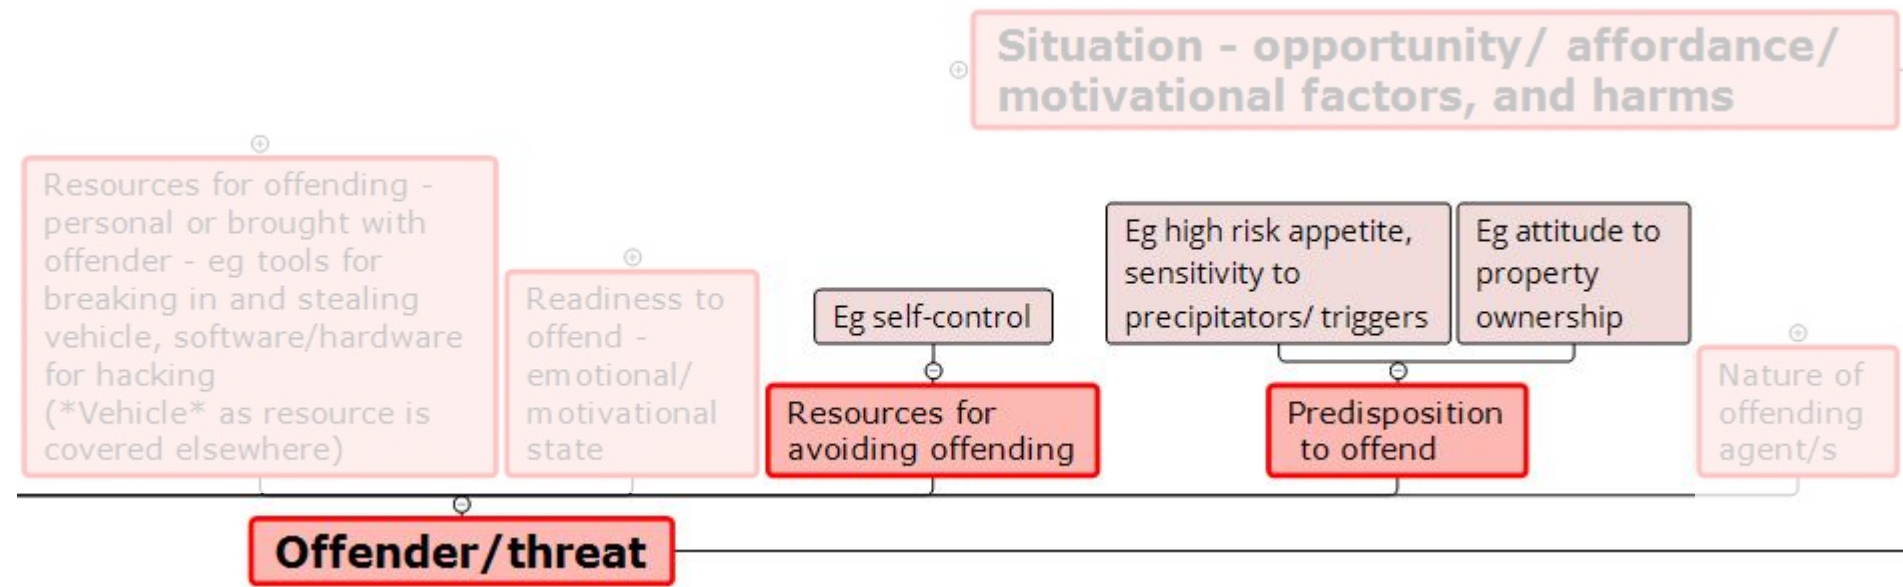

# Offenders and the threat they pose in vehicle crime: resources for offending (other than provided by vehicle itself)

Offenders and the threat they pose in vehicle crime: readiness to offend (current emotional/motivational state)

# Offenders and the threat they pose in vehicle crime: resources for avoiding offending, predisposition to offend

• To be extended

# Offenders and the threat they pose in vehicle crime: nature of offending agent
